PREFACE

An attempt has here been made to set up the Hindu temple conceptually, from the foundation to its finial. Its structure is rooted in Vedic tradition, and primeval modes of building have contributed their shapes. The principles are given in the sacred books of India and the structural rules in the treatises on architecture. They are carried out in the shrines which still stand throughout the country and which were built in many varieties and styles over a millennium and a half from the fifth century A. D.

The purpose of the Hindu temple is shown by its form. It is the concrete symbol of Reintegration and coheres with the rhythm of the thought imaged in its carvings and laid out in its proportions. Their perfection is a celebration of all the rites enacted during the building of the temple from the ground to its pinnacle. Nothing that is seen on the temple is left unsaid in the verbal tradition nor is any of the detail arbitrary or superfluous. Each has a definite place and is part of the whole.

The Hindu temple is the sum total of architectural rites performed on the basis of its myth. The myth covers the ground and is the plan on which the structure is raised.

1

Diacritical signs are used on Sanskrit words.

For typographical reasons they are partly omitted on small headings.

Pronunciation : a, at the end of words, is semi-mute.

c, like ch in chapel.

e, is always long.

h, following a consonant, is to be pronounced.

ñ, palatal ; ṇ, lingual.

o, is always long.

r, like ri.

ś (palatal) and ṣ (lingual), like sh.

THE SITE

TIRTHA AND TEMPLE

Life as a pilgrimage from birth to death has many stations. In India death is but another station and in itself does not bring final release (*mokṣa*). Final release from all conditions of existence, from all limitations, is gained through Knowledge (*Brahmavidyā*); and Knowledge, the realisation of Supreme identity, is the means and the end itself: it gives and is release. Some attain it while alive (*jīvan-mukti*), others at death. To the great mass of people, who are without the faculties and training to make them fit for the realisation of the Supreme Principle by Knowledge, other roads lie open which also lead to the Centre. Pilgrimage is one; it brings joy (*bhukti*) and release (*mokṣa*) to those who have achieved control of their minds and of the actions of their hands and feet; who have sapience (*vidyā*), and who have practised austerities and have a good name.¹

The places of pilgrimage are distributed through the entire country and are called Tirtha and Kṣetra. The number of these sacred sites is large; the 'Mahābhārata' speaks of hundreds of places of pilgrimage.²

Tirtha is the name of a place of pilgrimage on the bank of a river, the sea-shore or a lake. The meaning of the word is a ford, a passage. Water, the purifying, fertilizing element being present, its current which is the river of life can be forded in inner realisation and the pilgrim can cross over to the other shore. The place of pilgrimage is the end of the journey to the Centre; but it is not itself the goal and only the means for crossing over to the Centre. For this reason the number of Tirthas and Kṣetras is indefinitely large.³ For this very reason too no journey need be undertaken at all.

¹ 'Agnipurāṇa', ch. CIX. 1b-2a.

² 'Mahābhārata', Ādiparva, II. 2; Vanaparva, Tirthayātrāparva.

³ Kṣetra is sacred ground, a field of active power, a place where 'mokṣa', final release, can be obtained. The 'Garuḍa Purāṇa', I. XVI. 14, enumerates seven cities as givers of 'mokṣa'. They are: Ayodhyā, Mathurā, Māyā, Kāśī, Kāñcī, Avantikā, Dvāravati. The sacred geography of India recognises the whole country as a field of more than human activity. It is carried by the rivers, from the celestial region where they have their prototype and origin, down to the earth. Śaiva tradition knows the special potency of certain places (*pīṭha*) in India resulting from the fall to earth of the dismembered body of the dead Satī, a form which

There is one Tirtha where one should always bathe and this is the Tirtha of the mind (mānasatīrtha). It is deep, clear and pure; its water is truth (satya) and metaphysical knowledge (Brahmajñāna). Those who take this bath see the Principles, the true nature of things (tattvadarśin).⁴

The Tirthas and Kṣetras on Indian soil are potent sites where a presence is felt to dwell. Its support is in the place itself. Whatever makes the site conspicuous or memorable is reinforced in its effect by the attention of the people directed towards and concentrated on that spot. In such places "the gods are seen at play".

"The gods always play where lakes are, where the sun's rays are warded off by umbrellas of lotus leaf clusters, and where clear waterpaths are made by swans whose breasts toss the white lotuses hither and thither; where swans, ducks, curleys and paddy-birds are heard and animals rest nearby in the shade of Nicula trees on the river banks.

The gods always play where rivers have for their bracelets the sound of the flight of curleys and the voice of swans for their speech, water as their garment, carps for their zone, the flowering trees on their banks as earrings, the confluence of rivers as their hips, raised sand banks as breasts and the plumage of swans their mantle.

The gods always play where groves are near, rivers, mountains and springs, and in towns with pleasure gardens." ('Bṛhat Saṃhitā', LV. 4-8; 'Bhaviṣya Purāṇa', I. CXXX, 11-15). "It is such places that the gods love and always dwell in" ('Bṛhat Saṃhitā', 8, Comm., quoting Kāśyapa).

Mahāmāyā had assumed. Where its parts came to lie, the energy associated with the special part or limb was added to the earth, strengthening that particular spot and leading to an attainment of the corresponding faculty by man. Distributed in 51 centres the power of Mahāśakti is integrated in the soil of India. (Svāmī Karpātrīji has explained the 'Secret of the Sacred Places' in an article on 'Piṭha Rahasya', in 'Siddhānt', No. 35, Benares, 1941).

The realisation of the descent of more than human power to earth makes India a sacred land. Near the water and at other definite sites its presence is more strongly felt. Some of these consequently are laid out in a particular way, such as Kurukṣetra where the 4 corners of the potent field are marked each by one place of pilgrimage and the middle is occupied by the place of central sanctity ('Mahābhārata', Vanaparva, ch. LXXXI. 207; Cunningham, 'Archaeological Survey Report', Vol. II. pp. 214-217), or Pāṭaliputra, in the middle of 4 towns (P. Mus, 'Barabudur', 'Bulletin de l'École Française d'Extrême-Orient', Vol. XXXII, p. 669). In view of the 'descent' of the sacred power to the earth, it is ontologically its own projection from the beyond, along the vertical axis. This symbolism belongs not only to the sacred geography but more ostensibly even to the sacred architecture of India (Pt. V).

⁴ 'Mahābhārata', Anuśāsanaparva, CLXX. 2-3; 12-13.

While 108 chief places on earth, etc., and in the mind, are spoken of in the 'Matsyapurāṇa' (XIII. 26-54), chapter CII. 3-5, enjoins that three and a half times ten millions of Tirthas in heaven, earth and the atmosphere should be conceived as in the water where one takes the ritual bath by realising within it, in a square of four cubits, the sacred Ganges, the most holy of all Tirthas (cf. ch. CVI. 53).

The 'Mahānirvāṇatantra', X. 105, knows by still closer identification, that the "three and a half times ten millions of Tirthas and all the gods, Brahmā, etc., reside in the body of the Kaula and all the shrines and holy places which are in this world they all abide in the body of the Kulasannyāsin (the highest class of ascetic)"; ib., XIV. 174.

Where the gods are seen at play, in all these places, it is but 'the one God engaged in eternal play'.⁵ Play is the modality in which the Supreme Spirit displays his presence in the world. It is in its effortless movement and in the perfection of corresponding forms. There is no other reason for the appearance of the world than that which is in Brahman itself. It shows itself most convincingly at certain places. They have beauty; for it is there that the celestial intelligence, —the gods, intermediate between the Lord and man,—has its sport and display.⁶

The gods are installed not only in Tirthas, on the banks of rivers, lakes and on the seashore, at the confluence of rivers and estuaries, but also on hill-tops and mountain-slopes, in forests, groves and gardens, near the abodes of the blest or hermitages, in villages, towns and cities or in any other lovely place ('Tantra-Samuccaya', I. i. 28; see Frontispiece).⁷ Ritually, the site of the temple is a Tirtha wherever it is situated. The 'Viṣṇudharmottara' (Part III, chapter XCIII, 25-31), an early compendium, speaks of the installation of consecrated images (arcā): "Installations should be made in forts; in auspicious cities, at the head of shop-lined streets . . . ; in villages or hamlets of cowherds where there are no shops, the installations should be made outside in gardens, . . . Installations should be made at riversides, in forests, gardens, at the sides of ponds, on hill-tops, in beautiful valleys and particularly in caves. At these places, the denizens of heaven are present. In places without tanks, gods are not present. A temple therefore should be built where there is a pond on the left, or in front, not otherwise. If a temple is built on an island, the water on all sides is auspicious." The presence of water is essential; but if it is neither available by nature nor by artifice it is present symbolically at the

⁵ "Eko devo nityalilānurakta"; 'Rādhā Upaniṣad', IV. 3.

⁶ "Na prayojanavattvāt; lokavat tu līlākāivalyam". 'Brahma Sūtra', II. i. 32-33. "Brahmā's creative activity is not undertaken by way of any need on his part, but simply by way of sport, in the common sense of the word". A. K. Coomaraswamy, in 'Līlā', 'Journal of the American Oriental Society', 1941, pp. 98-100.

⁷ More than a millennium of textual continuity and identity of metaphysical foundation accompanies the practice of building temples in all their variety in the different parts of India at the various phases of its history. The elaborated later temples and explicit texts are an exposition of the meaning which is present in the form, from its beginning.

The authorities quoted are referred to in the present context not in their chronological sequence, but irrespective of it, in the meaning which they have in common. Their historical and geographical relation to the monuments however are considered in a later Part (VII) where the terminology of Indian temple architecture, their types and 'styles' are explained.

The text-books of Vāstu-Śāstra, the science of architecture, are records of oral traditions which go back into an undefined past. The 'Bṛhat-Saṃhitā', for instance, compiled by Varāhamihira in the middle of the sixth century A.D. is based on the authority of master architects whose names are Maya, Viśvakarman (ch. LV, 30), Garga and Manu. The 'Bṛhat-Saṃhitā' is but a brief account of their treatises (ib. śl. 31). It is the earliest datable source on Vāstu-Śāstra. The 'Viṣṇudharmottara' is of the seventh century approximately. The 'Tantrasamuccaya' of Nārāyaṇa Nambūdiri of Kerala, Malabar, belongs to the fifteenth century.

The Frontispiece gives a general view of Amarakantaka in Rewa State, central India; this is the Omkāra Kṣetra. The great sage who practises austerities there becomes a 'jīvan-mukta'. The 'Matsyapurāṇa', CLXXXVI and CLXXXVIII, praises this Tirtha. Its present temples date from the eleventh century to recent times.

consecration of temple or image. Thus it is described how during the rite of 'adhivāsana' by which the divinity is made to assume its abode in an image about to be installed, the image of Viṣṇu is laid to rest on the world serpent Śeṣa (Ananta), on a ford raised for this purpose in a river, lake or tank. Offerings are made to the Lord (Yogeśa), to the Śabda-Brahman,—the principle of articulate sound, or the Word,—to the oceans, mountains, Sages (ṛṣi), Fathers (pitṛ) and Spirits (bhūta). Varuṇa, the presiding divinity (of the waters) and Siva, the Lord of the sacred Tīrtha are worshipped; should neither river, lake nor tank be near, three jars of water are placed in the Brahmasthāna, the centre of the sacred site.⁸

Temples are built where Tīrthas are; their towering shapes to the last point of their height teem with forms which have the urge and fullness of Indian nature; step by step, level by level they lead the eye and mind of the devotee from this world to the worlds above. The temples rise from a broad base: differently built according to specific types, they have their variations in time and place and their shapes were elaborated in many schools. As they are to-day in southern India their high superstructures ascend in pyramidal form, while in northern India they fling their curvilinear faces towards a meeting point above the sanctuary.⁹

Sometimes the temples form cities of God with many buildings of great extent and complex design, or the temple is but a small chapel only. Wherever a Hindu temple stands, whatever age witnessed its growth, and to whatever size, as house, body and substance for God (the Essence) to dwell in, it is built in principle on the same plan, the Vāstupuruṣamaṇḍala.

Although this ritual diagram is neither the ground-plan of the temple nor necessarily the plan of the site, it regulates them. It may be coterminous with the site of the sacred precinct, or with the extent of the main temple building (prāsāda) only; or it may be drawn on an altar, and of standardised size.¹⁰ It is drawn on the ground prior to the building of the temple and on it the temple

⁸ 'Vaikhānasāgama', ch. XXXI; summary of the respective passage.

⁹ The South Indian temples are distributed over an area which in extent is one-fifth only of India.

¹⁰ The 'Bṛhat Samhitā', ch. LV. 10, prescribes the Vāstumaṇḍala of 64 squares for temples. Ch. LII. 42-54, gives the Vāstumaṇḍala of 81 squares, also for other buildings, and for towns, villages, etc.

The 'Agnipurāṇa', ch. XCIII. 42, lays down 5 cubits (hasta; 7½ feet) square as standard size of the Vāstu, if not otherwise specified; its 'best' measure however is equal to that of the building which contains the sanctuary (grha-prāsāda), the temple proper. The latter definition is also given in the 'Samarāṅgaṇasūtradhāra', ch. LIX. 3, where however the plan to the end of the two diagonals of the Prāsāda or Vimāna, the temple proper, is stated to have 81 squares. This is in agreement with 'Īśānaśivagurudevapaddhati', Part III. ch. XXVII, 50; (translated by St. Kramrisch in the 'Journal of the Indian Society of Oriental Art', Vol. IX, p. 167).

In ch. X, 4; 69; 78-80, of the 'Samarāṅgaṇasūtradhāra', the Vāstu of 64 squares, however, comprises the entire building site of a [fortified] town (pura) or of a city (nagara) and this seems to apply also to villages (grāma) and hamlets (kheṭa).

The whole building site, the entire planning of town and temple and of the building of the main sanctuary, the Prāsāda, or Vimāna, conform with the Vāstupuruṣamaṇḍala, so that the gods dwell there in peace.

THE SITE

stands either in fact or symbolically. In principle it is always square and is the record of an architectural rite. The knowledge of its correct execution forms the first part of the science of architecture ('Samarāṅgaṇasūtradhāra', ch. XLV. 2). The square is divided into compartments and the diagonals are drawn. The name of the square is Vāstupuruṣamaṇḍala. Puruṣa is the universal Essence, the Principle of all things, the Prime Person whence all originates.¹¹ Vāstu is the site; in it Vastu, bodily existence, abides and from it Vāstu derives its name. In bodily existence, Puruṣa, the Essence, becomes the Form. The temple building is the substantial, and the 'plan' (maṇḍala) is the ritual, diagrammatic form of the Puruṣa. Puruṣa himself has no substance. He gives it his impress. The substance is of wood, brick or stone in the temple.

The form of the temple, all that it is and signifies, stands upon the diagram of the Vāstupuruṣa. It is a 'forecast' of the temple and is drawn on the levelled ground: it is the fundament from which the building arises. Whatever its actual surroundings, forest glade, seashore, hill or town, the place where the temple is built is occupied by the Vāstupuruṣa in his diagram, the Vāstupuruṣa-maṇḍala. That it is surrounded by the streets of a town, walls of a fort, ravines or fields, becomes of secondary importance, for its particular topography is but the hinge by which a changeable panorama is linked with the structure of the universe. The site is ritually levelled each time a temple is built; the ground from which the temple is to rise is regarded as being throughout on an equal intellectual plane. It is at the same time terrestrial and extra-territorial. It is the place for the meeting and marriage of heaven and earth,¹² where the whole world is present in terms of measure, and is accessible to man.

SITE AND BUILDER

Man here is the patron or Yajamāna (lit. the sacrificer) on whose behalf the temple is built by the architect who is guided by the priest in the principles of his work. In the diagram of the Vāstupuruṣa a communication is established between man (puruṣa) as the patron of the work and the Puruṣa, the Essence of all things. At the definite time and place where the temple is to be set up, all times and all places congregate in the symbolic diagram of the Vāstupuruṣa. On this ritual drawing rests the super-structure of the temple, which is the manifestation (mūrti) of God.¹³ The ritual diagram of the Vāstupuruṣa is drawn wherever the site is

¹¹ 'Harivaṃśa', ch. I; R. Guénon, 'Quelques Remarques sur le Nom d'Adam', 'Études Traditionnelles', 1931, pp. 726-31.

¹² "Once heaven and earth were united. Separating, they said: Let what is suitable to the sacrifice be common to both." 'Taittirīya Brāhmaṇa', I. 1. 3. 2-3; 'Tāṇḍya Brāhmaṇa', X. 6. 1-3; etc.

Heaven and earth, once joined, subsequently separated. The beings, the 5 classes of them, gods, men, and so on, did not keep peace. The gods brought about a reconciliation of these worlds. Both contracted a marriage according to the rites observed by the gods.

¹³ 'Īśānaśivagurudevapaddhati', Pt. III, ch. XII. 16; JISOA, Vol. X, p. 225.

prepared for this purpose. The preparation is in the readiness and discipline of the mind and heart of the patron and of those who are entrusted with the work because they have the competent skill. The priest has the guidance; the architect, who builds the temple, works in conformity with the knowledge of the priest.

A pilgrimage or visit to a temple is undertaken for the purpose of looking at it (darśana) with the sight of knowledge. Darśana is also the name of the six traditional points of view or methods of cognising Truth.¹⁴ The architect of the temple was not only a master of the 'ocean of the science of architecture'. Balanced himself in body and mind, he had to be versed in the traditional science (śāstra) in its various branches, and as much in the knowledge of rhythms (chandas),¹⁵ mathematics and astronomy as in the conditions of different places, etc. ('Samarāṅgaṇasūtradhāra', XLIV. 2-4, and 'Vāstuvīdyā', I. 12-15). The various arts and sciences had to be known for one and the same purpose, so that he could apply them in his work which was to be an image and reconstitution of the universe.

In the 'Samarāṅgaṇasūtradhāra', a treatise on architecture, the author, King Bhoja of Dhārā, who ruled over Mālava in the first part of the eleventh century, says: "He, who begins to work as an architect (sthapati) without knowing the science of architecture (vāstuśāstra) and proud with false knowledge must be put to death by the king as one who ruins the kingdom (rājahiṃsaka); dead before his time, his ghost will wander on this wide earth. He, who though well versed in the traditional science is not skilled in the work will faint at the time of action like a timid man on the battle-field. He, who is expert only in his workmanship, but unable to understand the meaning of the traditional science, will like a blind man be misled by anyone" (S.S. XLIV. 6-10). Even so, he who knows the traditional science and its meaning and masters the craft, is not as yet the perfect architect. For immediate intuition, a readiness (pratyutpanna) of judgment (prajñā) in contingencies, and the ability to fuse them into the requirements of the whole, are the distinctions of a true Sthapati.¹⁶ It is then, that the builder himself, once his work is completed, is struck with wonder and exclaims: "Oh, how was it that I built it."¹⁷

¹⁴ They are: Nyāya, Vaiśeṣika, Sāṅkhya, Yoga, Mīmāṃsā and Vedānta. While Vedānta cannot be realised without Yoga, Darśana, a direct seeing of the meaning which the temple demonstrates, presupposes Yoga.

¹⁵ This refers to the rhythmical disposition of the ground-plan, for example (Pt. VII).

¹⁶ *ib.*, verse 14, paraphrased.

¹⁷ This is expressed in a copper-plate inscription from Baroda of a Rāṣtrakūṭa king of Gujerāt, and is said to refer to the Kailāsanātha temple at Elūra (Elāpura), a Kīrtanam which the king "caused to be made in the hills at Elāpura, a wonderful building, on seeing which the best of immortals who move in celestial chariots, struck with wonder think much constantly, saying: This temple of Śiva is self-existent; in a thing made by art such beauty is not seen. The Silpin (architect) of this temple in consequence of the failure of his energy as regards (the construction of) another such work, was himself suddenly struck with wonder, saying: Oh, how was it that I built it!" ('Epigraphia Indica', Vol. I, p. 159; R. G. Bhandarkar, 'The Rāṣtrakūṭa King Kṛṣṇarāja I', 'Indian Antiquary', Vol. XII, p. 228 f.).

The architect, Sthapati,¹⁸ is the foremost of the craftsmen (śilpin), of whom there are four classes, Sthapati, Sūtragrahin, Takṣaka and Vardhakin, the designing architect, surveyor, sculptor and builder-plasterer-painter. These craftsmen carry out the instructions of the Sthāpaka, the architect-priest, who has the qualification of an Ācārya. The relation of priest and executive craftsman corresponds to the rule laid down for Christian art in the second Council of Nicaea (787 A.D.): "His art alone belongs to the painter, its organisation and arrangement belong to the clergy." It is defined in the 'Śilparatna' (I. 29-42) in which it is said of the Ācārya or Guru, who is the Sthāpaka :

"He who wishes to build villages, etc., or royal palaces, etc., tanks, etc., or temples, should select a Guru and Śilpin for this purpose. Let the Guru be a Brāhmaṇa of high born family, who has performed all the sixteen purificatory rites, who knows the essence of the sacred texts, the Vedas and Āgamas, and who observes the rules of conduct according to his caste (varṇa) and stage of life (āśrama), who has received initiation (dīkṣā), is competent, exerts himself in his work (tapasvin) and is a believer (āstika) in the sacred tradition.

¹⁸ Sthapati, in 'Āpastamba Śrauta Sūtra', XXII. 7. 6, designates the Yajamāna, the sacrificer who is to be consecrated as priest. As builder of the Hindu temple, the Sthapati, by his special knowledge guided by the Sthāpaka is competent to act for his patron, the Yajamāna. ('Īśānaśivagurudevapaddhati', Pt. III, ch. XXVI ; JISOA, Vol. IX, p. 152 f). The patron is also designated as Kāraka, who makes the architect, the Kārtṛ, do the work ('Samarāṅgaṇasūtradhāra', LVI. 303).

The Sthapati who is called Viśvakarmā, in 'Mayamata', V. 13 f., is described as a disciple (anuśiṣya) of the Sthāpaka, ib. XII. 35 f. This essential relation is ignored by P. K. Acharya, in his 'Dictionary of Hindu Architecture', s. v.

The Sūtragrahin or Sūtradhāras, who hold the cord (sūtra, śulva, rajju, etc.) [originally the bamboo rod (veṇu)] in the construction of the Vedic altar, have been, it appears, described by Democritus (440 B.C.) as Harpedonaptai.

The descent and fall of the Hindu architect and the craftsmen, from their celestial origin, and from Vedic tradition is told in the 'Brahmavaivarta Purāṇa', I.X. 20-23f.

Viśvakarman begot nine illegitimate sons on a Śūdra woman : They are named Mālākāra (garland maker), Karmakāra (blacksmith), Saṅkhakāra (conch shell carver), Kuvindaka (weaver), Kumbhakāra (potter), Kāmsyakāra (metal worker), Sūtradhāra (architect, carpenter), Citrakāra (painter), Svarnakāra (goldsmith). All of them are expert in the arts (kalā) but the last three being cursed by a Brāhmaṇa became unholy and were deemed incompetent by the Śāstras to offer sacrifices.

Viśvakarman cursed by Ghṛtācī (an Apsarā) descended to earth and was born by a Brāhmaṇa woman. Viśvakarman when he came to the world as a Brāhmaṇa was regarded as an unparalleled architect in view of the very grand, extraordinary and royal mansions which he constructed. He also instructed ordinary people on matters relating to architecture in various ways.

Svarnakāra became outcasted and unholy on account of the curse pronounced against him by a Brāhmaṇa whose gold he had stolen. Sūtradhāra neglected to carry out the orders of a Brāhmaṇa to collect fuel for sacrificial purposes, and being cursed by him, was likewise degraded. Citrakāra transgressed the orders of a Brāhmaṇa in respect of a picture the composition of which was defective and not according to the rules and underwent the same fate.

It was then that the original function of art (śilpa) was lost. The destination of works of art is defined in the 'Āitareya Brāhmaṇa' VI, 5. 27 : "Śilpāni, works of art of men, are an imitation of divine forms ; by employing their rhythms a metrical reconstitution is effected of the limited human personality" (trans. by Coomaraswamy ; in 'La Nature du Folklore', É. T., 1937, pp. 206-18).

First a Sthapati is to be selected—one well versed in the *Silpa-śāstras*; similarly, a Sthāpaka also, knowing the *Silpa-śāstras* and possessing all the qualifications of an Ācārya, being selected by the patron, should perform the architectural rites (*vāstu-karma*). The temple (*vimāna*) or any other (construction), begun by these two should be continued by them only and by no other. In case they be not available, the work should be done by either their sons or disciples who are competent in the work." Then follows the description of the four classes of craftsmen (*śilpin*).

"The Sthapati should be fit to direct (*sthāpana*) the construction and should be well-versed in all *Śāstras*, the traditional sciences, perfect in body, righteous, kind, free from malice and jealousy, a Tāntrik and well-born; he should know mathematics and the *Purāṇas*, the ancient compendia of myths, etc., painting, and all the countries; he should be joyous, truth speaking, with senses under control, concentrated in mind, free from greed, carelessness, disease and the seven vices ('*Manu-Saṃhitā*' VII. 47-48), famous, having firm friends and having crossed the ocean of the science of *Vāstu*.

The disciple or son of the Sthapati is the *Sūtragrahin*. He should always carry out the orders of the Sthapati, should be expert in all sorts of work, and should know the proportionate measurement by the cord (*sūtra*) and rod (*daṇḍa*) as applied to the whole building and its parts (see Pt. VII), the horizontal and vertical proportions (*māna*, *unmāna*).

The *Takṣaka* is so called because he cuts off and carves (*takṣ*) the large pieces and the subtle detail. He is also expert in working in clay. He should be qualified, able, and capable to perform all sorts of work on his own initiative, in the right way, devoted to the Guru, ever cheerful, and obedient to the Sthapati.

The *Vardhakin* is so called because he increases (*vr̥dh*) [by placing together what the *Takṣaka* has carved and by adding to the finished work, the painting] and he always follows the *Sūtragrahin*.

Without these four nothing can be undertaken. Therefore all these four, the Sthapati and the others, should always be honoured."

Vāstu-śāstra, the traditional science of architecture, is subordinated to, and forms an auxiliary part of the Veda, the primordial Knowledge; in it intellectual intuition is laid down as sacred word.

Vāstu-śāstra belongs to, and is, applied astrology. *Varāhamihira*, in his '*Bṛhat-Saṃhitā*' introduces the chapter on architecture (LII) saying: "*Vāstu-jñāna* (the knowledge of *Vāstu*), architecture, will be explained by me for the pleasure of the astronomers and astrologers, as it has been transmitted from *Brahmā* to our days through an unbroken series of sages." Building is begun under favourable stars. They are consulted when the ground is taken possession of and when the rite of depositing the Germ of the temple is performed. The regents of the planets and the stars have their allocation in the diagram of the temple and their images are carved on its walls. By them are regulated the measurement of the whole building and its parts; the life of the donor (*yajamāna*), and the age of the temple too. The temple is built in the likeness of the universe and is its reduced image. The architect of this world image, the temple, is looked upon as descended from, and in his sphere alike to, *Viśvakarman*, who made all

that exists in the universe.¹⁹ The architect in charge of the building is therefore generally called Sthapati. The name means "master of what stands or abides". The science of architecture, called as a rule, Vāstu-śāstra, is also named Sthāpatya-śāstra-veda. It is the knowledge of ordered and planned extension (vāstu) and is put into practice by the master who makes existing things (vastu) abide in order. Sthāpatya-śāstra-veda is enumerated as an Upaveda, a lesser, applied knowledge subordinated to the Atharvaveda.²⁰ Vāstu-śāstra in its fullest exposition belongs to Tantra which is the applied knowledge of the Atharva Veda. As a ritual, architecture is moreover doubly linked with the primordial Knowledge, the Veda, and is included in two of the six Vedāṅgas. These are appendices which are auxiliary to the Veda. The fifth Vedāṅga, astronomy-astrology, Jyotiṣa, and the sixth Vedāṅga, Kalpa, in which are laid down the rules of the sacrificial acts, the ritual, are both, in parts, essential constituents of the science of Indian architecture.²¹ The Śulva-sūtras contained in the Kalpa-sūtras, represent the rules and give proportionate measurement for laying out and piling up the Vedic altar.²² On them, basically rests the building of the Hindu temple.

The Vāstupuruṣamaṇḍala, the diagram of the temple, is a Yantra. ('Vāstu-vidhāna' of Nārada, Ms. 1602, Adyar Library; VIII. 26).²³ A Yantra is a geometrical contrivance by which any aspect of the Supreme Principle may be bound (yantr, to bind; from the root 'yam') to any spot for the purpose of

¹⁹ With regard to the making of the universe, Viśvakarman is the working, Brahmā the thinking aspect of the Supreme Principle.

²⁰ The other Upavedas are: Āyurveda (medicine), attached to the R̥g Veda (acc. to Suśruta, I. 3, to the Atharva Veda); Dhanur Veda (military science) attached to the Yajur Veda, and Gāndharva Veda (music) attached to the Sāma Veda; cf. Apte, Dictionary, s. v.

Sthāpatya Veda, the science of architecture; Āyurveda, the science of longevity, medicine; Dhanurveda, military science, and Jyotiṣa, the science of the luminaries,—astronomy and astrology,—are enumerated by the side of one another, in the 'Samarāṅgaṇasūtradhāra', X. 77; also 'Bṛhadśilpaśāstra', I. 10.

Tantra, as a rule, is enumerated as Upaveda attached to the Atharva Veda. Tantra includes Vāstu-śāstra.

According to the 'Sukranīti-sāra', IV. 3. 27-30, Śilpa-śāstra is included in the 32 Vidyās. Śilpa-śāstra is defined, 58, as the science which treats of palaces, images, parks, houses, etc.

²¹ The six Vedāṅgas are: Śikṣā, recitation (articulation and pronunciation); Chandas, metrical science or the science of rhythms; Vyākaraṇa, grammar; Kalpa, ritual; Nirukta, hermeneutics, etymology; Jyotiṣa, astronomy-astrology ('Sukranīti-sāra', IV. 3. 28-29).

²² The main subjects included in the general education of a Hindu were: Lipi or Lekhā (the alphabet, reading and writing), Rūpa (drawing and geometry) and Gaṇanā (arithmetic). These subjects were taught from the age of 5 till the age of 12, and in their higher stages up to the age of twenty-five. The Hathigumpha inscription, 163 B.C. says that King Khāravela spent 9 years, from the age of 16 onwards in the study of Lekhā, Rūpa, Gaṇanā.

A knowledge of form (rūpa), number and proportion was an indispensable equipment; mathematics and architecture had their root in the Vedic altar. The indissoluble connection of number and form remained a consciously employed knowledge throughout. In the middle of the ninth century A.D. the mathematician Mahāvīra, in his 'Gaṇitasāra-saṃgraha', I. 9-19, speaks of the use of the science of number (gaṇita) in architecture and in all that constitutes the peculiar value of the arts (B. B. Datta and A. N. Singh, 'History of Hindu Mathematics', Pt. I, p. 5).

²³ The MS. is in Grantha script; Chapters VIII and X are published in the Appendix, in Devanāgarī.

worship. It is an artifice in which the ground (bhūmi) is converted into the extent of the manifested universe. The nameless, formless entity which is bound in this case to the spot within the square maṇḍala is known henceforth as Vāstupuruṣa. The components of the artifice are : the ground on which the maṇḍala is drawn; the form of the maṇḍala; and its name together with the names comprised in its form.

THE STABILITY OF THE SITE

The temple must be built according to definite rules, and it must be firm (dr̥ḍha; 'Īśānaśivagurudevapaddhati', III. ch. XXVII. 82; 'Vaikhānasāgama', ch. VII). The latter injunction seems too obvious to have been made. But it does not primarily refer to a substitution of flimsy materials, such as mud, sand, wattle walls and bamboo posts by those of greater permanence; nor to the avoidance of careless construction in brick or stone nor to the desirability of such additional wall strength which would withstand earthquakes. With particular emphasis the earth itself is evoked as firm (dr̥ḍhā) in the R̥gveda (X. 121. 5; X. 173.4) and firmly established (pratiṣṭhā; 'Śatapatha Brāhmaṇa', VI. 1.1.15), and Earth, the goddess, is invoked to stand firm for our well-being ('Vājasaneyasaṃhitā' XI. 69; 'Taittirīya Saṃhitā', IV. 1.9.2; Ś.B. VI. 6.2.6.). When a house is about to be built, an oblation is poured into the pit to the "steady one", Vāstoṣpati ('Āśvalāyana Gṛhya Sūtra' II. 8.15; 'Pāraskara Gṛhya Sūtra' III. 4.3). A fear is allayed by these epithets, oblations and invocations. It is the fear of uncertainty, of the changeable and transitory. By being 'firm' the earth becomes secure and a reliable support. For 'before she was fixed, mother earth' is spoken of as 'the ever wandering' (AV. V. 2.6). The rule of order under which buildings can be set up and in which men and gods are at home, is not from the beginning. There was unrest and instability. Yama, the god of Death, the first of mortals who preceded men on the path to heaven (RV. X. 14.1) assigns a station to everything that is movable. Yama, the Order of things in the cosmos and Righteousness in men, who is the Dharmarāja, 'King Law', establishes in this manifested world the immutability of the Supreme Principle. "Yama indeed rules over the earth" (Ś.B. VII. 1.1.3.). As it was in the beginning, so is it repeated with each building; Yama gives the residence when man builds the small world of his own, his house, or a temple in the likeness of the world, which is God's residence.

With regard to the builder, such a settlement too takes place in the intellect itself at the moment when its work is being given concrete form. The substance is its support and form is the nature of its activity. The form of the concrete work is the final seal of the process which leads to it; it bears the impress of Yama.²⁴

²⁴ 'Śatapatha Brāhmaṇa', XI. 2. 3. 5. These indeed are the two great manifestations (yakṣye) of the Brahman (the Supreme Principle) . . . One of these two is the greater, namely, Form (rūpa) for whatever is Name (nāma), is indeed Form.

King Bhoja, in the 'Samarāṅgaṇasūtradhāra' (VI. 5-27; VII. 7-34) recounts the afflictions of men when the wishing-trees (kalpadruma) which in the Kṛta Yuga had been their home and sustenance, and when the gods too withdrew to heaven.²⁵ It was, then, that King Pṛthu, the first of men who was installed as a king, attacked Pṛthivī, the earth, with his bow in order to level her ('Samarāṅgaṇasūtradhāra', I. 6-24) for she was full of mountains, obstacles to communications and order which he had set himself to establish. But she ran away in fear, changing her shape into that of a cow and took refuge with Brahmā, the creator, whom also King Pṛthu then approached. Brahmā mediates between them, makes King Pṛthu the protector of Pṛthivī, the earth, and makes her yield to him the crops and the sites for building towns of men and gods.

King Pṛthu does his work at a definite stage in the 'history' of the world: his prototype is Yama, the Dharmarāja, 'King Law and Order'. King Pṛthu who has made the earth yield, and she, the wide, the 'broad one', Pṛthivī (Ś. B. VII. 4.2.6), are thence connected in fact and name. Her fugitive, errant state has found rest.²⁶ The earth will no more run away. She exists protected by law and order. This contract is sealed when her plains are ploughed and her ground is levelled for buildings. It is then that the earth is a place of abode (āyatana) for all gods (Ś.B. XIV. 3.2.4.) and the building ground (bhūmi)²⁷ the share of the gods ('Śāṅkhāyana Grhya Sūtra', III. 3.2).

Full of life is the earth: it lurks in her and hovers above her. The 'genii loci' are many.²⁸ It is necessary that they should depart when a particular spot on the surface of the earth is chosen at the proper time for being commuted into the level and plan of the temple. The site is taken possession of for that divinity whose presence will be invoked and beheld in the temple. Those entities that were active in the site hitherto would be redundant;²⁹ they are asked to leave, with the rhythmic formula (mantra): "Let spirits (bhūta), gods (deva) and demons (rākṣasa) depart and seek other habitations. From now this place belongs to the divinity whose temples will be built here" ('Brhat Saṃhitā', LVIII. 11; 'Īśānaśiva-gurudevapaddhati' Pt. III., ch. XXVI, 73-74; 'Mayamata', IV. 1, f; 'Viṣṇu-

²⁵ The Kṛta Yuga or Satya Yuga, which is the Perfect or Golden age, is followed by the Tretā, Dvāpara and Kali Yugas successively. Their duration is, respectively, 4,000, 3,000, 2,000 and 1,000 years of the gods. One day of the gods is equal to one year of men ('Manu Smṛti', I. 67). 400, 300, 200 and 100 twilight years of the gods precede and follow each Yuga. The four Yugas with their Sandhyās are one Yuga (mahāyuga), of the gods.

²⁶ This story is told in other versions in the 'Viṣṇu Purāṇa', I. Ch. XIII. and in other Purāṇas.

²⁷ Ś. B. VII. 4. 2. 6-7. Earth, the wide, the broad one, is Pṛthivī; Earth, as substance, is Bhū; Earth, as ground, is Bhūmi.

²⁸ In the last verse of the Vanaparva, LXXXI, of the 'Mahābhārata', the sacred site of Kurukṣetra is known as the Uttara Vēdi of Brahmā (p. 4). Its four corners bear the names of the resident Yakṣas, Ratna, and so on. The Yakṣas are held to be the resident divinities, also by the Buddhists; see S. Lévi, 'Catalogue Géographique du Yakṣa dans la Mahāmāyūrī' (3-4th century A.D.), 'Journal Asiatique', 1915, I. p. 19 ff., 'Sumaṅgalavilāsini', S. B. B. III, Pt. 2, p. 92; cf. P. Mus, 'Barabudūr', op. cit., p. 660. "The geomancers recognise the divinities down to a depth of 30 cubits. Here dwells a Nāga, here a Yakṣa".

²⁹ Ś.B. VII. 1. 1. 5. "With a Palāśa branch (he sweeps). The Palāśa tree is the Brahman. He thus sweeps away those already settled."

samhitā', XII. 36 f; 'Agnipurāṇa', XXXIX. 16-18; 'Mānasāra', V. 4-9; etc.). With offerings, gods, spirits and demons are bid to leave. This gracious gesture releases their forces and sets the site free from all particular associations. In this way, too, it is steadied and expurgated. Emptied of its former contents, it retains its receptiveness and the power to assimilate new ones; finally it will have to be levelled and the plan and forecast of the temple will be laid out on the ground.

PURIFICATION, INSEMINATION AND LEVELLING OF THE SITE

Before this can be done the fitness of the soil has to be ascertained by several tests. A pit is dug and the earth which has been taken out is put back again. In a descending degree of its quality, it then either exceeds the pit in quantity, is level with it or lower; or, water is put into the pit over night: the quality of the soil is judged according to the quantity of the water found there in the morning; or, a flame put into the pit burns, or else is extinguished, in the latter instance the soil is unsuitable and has to be abandoned. These and other practical tests are described in the 'Bṛhat-Samhitā' (LII. 90-92) and elsewhere,³⁰ they are performed after the sound, smell, taste, shape or the consistency and colour have been examined; finally, the fertility of the soil must be tested. The 'Matsya-purāṇa' (ch. CCLIII. 12-18), prescribes according to the colour of the soil, white earth for Brāhmaṇas, red for Kṣatriyas, yellow for Vaiśyas, black for Śūdras. The castes and the earth correspond magically to the colours. Then comes an examination of the flavour of the earth, whether sweet, pungent, bitter, astringent, and its suitability is determined in the same 'hierarchy'. When the suitable land has been acquired and the ground is ploughed, seeds are sown and the quality of the soil is tested according to their germination in 3, 5, or 7 nights, etc., and according to the size of the young plants.³¹ All this is being done to assure oneself of the fitness, and ritual purity of the soil. For the same reason all extraneous matter (śalya, 'thorns') has to be removed from the soil,³² so that it does not stand in the way of the divinities who henceforward will be assigned their places; its presence also forebodes evil to the builder and is felt as an uneasiness and local irritation in various parts of his body. Magic is active and divinatory science establishes the correspondence between the soil to be built on and the body of the builder.³³ Either has to be made pure by the respective rites,

³⁰ The 'Bhaviṣya Purāṇa', ch. CXXX. 45-46, prescribes that this pit should be dug in the middle of an area of 4 cubits (hasta) square. Its measure should be 10 aṅgulas (the width of the upper phalange of the thumb) square and one cubit deep.

³¹ See also 'Mayamata', III, IV; 'Kāśyapaśilpa', I. 56-57; 'Mānasāra', V, etc.

³² 'Īśānaśivagurudevapaddhati', Pt. III, ch. XXVI, 92 f.

³³ Magic consists of actions expressive of a will for reality. The correspondence is constructed as a token of identity between the soil which will be 'transubstantiated' into the body of the Vāstupuruṣa and the person of the patron as Yajamāna or sacrificer. The external signs are a superstition, a residue of the belief in the identity of sacrifice and sacrificer, and with reference to the temple, in the identity of the sacrificial structure and the transformed body of man, the patron.

ready for setting up the temple, beginning each work on an auspicious day, and under a favourable star. The purification of the soil is complete when the ground has been ploughed repeatedly ('Kāśyapaśilpa', I. 42-56), watered, sown and planted with all kinds of grain and when these have flowered and ripened. Then it should be ploughed again. Then the earth is clean ('Viṣṇu-Saṃhitā', XII. 36-42).

At the beginning of the various phases in the construction and consecration of the temple, the "rite of the seeds and their germination" (aṅkurārpaṇa) is most important. It precedes the building of the temple ('Vaikhānasāgama', ch. II) and again the rite is observed before the last brick or stone is put into the superstructure (ib., ch. VIII), and once more prior to the installation of the main image and before the rite of opening its eyes (akṣi-mocana; ib., ch. XI) and also prior to the consecration of the sacrificial vessels (ib., ch. XXIX).³⁴ On the ninth, seventh, fifth or third day, prior to the performance of any of these rites, the seeds of different varieties of rice, kidney-bean, pulse, sesamum, mustard, etc.³⁵ are placed on a copper vessel, in front of Soma, the Moon, Soma, the totality of all oblations, the Lord of germs, the divinity who presides over formation. The 16 vessels used in this rite are circular like the lunar disc, the number corresponds to the digits of the moon, and further lunar symbols pervade this rite.³⁶ Their potency is given to the plants as they grow, to each variety in due season.

Vedic rites introduce and accompany the building of the temple. The ploughing and the sowing of the sacrificial ground with all kinds of grain preceded the piling of the Fire altar (agni-cayana).³⁷ After the introductory libation (prāyaṇīya) of the Soma sacrifice, the altar site was ploughed by twelve oxen, twelve furrows were made and then the seeds were sown. From the making of the Mahāvedi of the Fire altar and the sowing of the sacrificial ground, the rite of auspicious germination (maṅgalāṅkura; 'Kāmikāgama', XXXI. 18, etc.) has remained an indispensable preparation of sacred architecture. "Even as this broad Earth received the germ of all things that be" (AV. V. 25.2), is the Germ (garbha) of the temple deposited in her. The structure of the temple that grows from this Germ absorbs the essence of the earth and transmutes it. Its shape is produced from the power of the earth (bhū); and its form corresponds to the plan laid out on its levelled surface (bhūmi).

The spirits that previously occupied the site have been asked to leave. Tribute has been scattered to them at night and again when they depart before day-break.³⁸ When the ground is tilled, the past ceases to count; under auspicious stars new life is entrusted to the soil and another cycle of production begins, an assurance that

³⁴ Also 'Vaikhānasāgama', ch. XIII. 'Without the rite 'aṅkurārpaṇa', all rites performed are futile' (ib., ch. XXX).

³⁵ Or also of barley, wheat and other alternatives.

³⁶ 'Vaikhānasāgama', chs. XXIX, XXX; sixteen vessels of each kind if the Vajamāna is a Brāhmaṇa but 4 less respectively for a Kṣatriya, Vaiśya and Sūdra.

³⁷ 'Kāṇva-Saṃhitā', XX. 3. 4; 'Maitrāyaṇīya Saṃhitā', III. 2. 45; Ś. B., VII. 2. 2. 1-14.

³⁸ 'Mañjarī', quoted in Ī. P., Pt., III, Ch. XXVI, 74 f.

the rhythm of nature has not been interfered with. The sowing of the grain is a final offering to the memory of the spirits who have left the place and gone elsewhere, in peace.³⁹ It is at the same time a first offering in the newly acquired land, so that the temple, the substance of God and his manifestation, might exist. Their germination leads to a fulfilment of all their potentialities. The grain has the nature of the sacrificial essence itself for it is said in the Śatapatha Brāhmaṇa, from man, the sacrificial victim, this essence passed to the sacrificial animals, it entered into the horse, ox, sheep and goat, and lastly into the earth with its rice and barley, etc. (Ś.B. I. 2.3. 6-7). Their seeds are sown in the earth, they will germinate, grow, ripen and bear fruit on the site where the temple is to arise. The vital assimilation of energies of the soil into the grain and plants is carried further and through vegetation to the cattle on the pasturage. "The Sthapati, the chief architect, should graze cows with bulls and calves on the land till it is stamped down by the cows and homage is paid to it by their breath; its impurities are cleaned away by the bellowing of the bulls; it is washed with the milk and froth dropping from the mouths of the calves, smeared with cowdung, decorated with hoof-prints and fallen cud, scented with bovine odour and purified with sacred waters" ('Mayamata', IV. 4-8). That the cattle stay on the land, ensures its further purification ('Manu Smṛti', V. 124). The whole process of plowing, sowing and reaping, of grazing the cattle on the site of the future temple should be repeated after one year ('Mañjarī', quoted in I.P., l.c., 78-f). The plough being consecrated by the touch of the Guru, the chief architect should plough the first three rounds ('Mānasāra', V. 85). The preceptor and the builder perform the rite of ploughing and Śūdras complete the work.

Now the earth has been ploughed up repeatedly and has become pure and even, so that it only needs to be finally levelled to be ready for the drawing of the Vāstupuruṣamaṇḍala, the metaphysical plan and forecast of the temple.

"The ground should be perfectly even all over, like a mirror" (I.P., Pt. III. ch. XXVI. 79): Pṛthivī, the Earth, is here the levelled ground from which the temple rises. Her terrestrial surface (bhūmi)⁴⁰ has now been properly prepared; as far as the building ground extends, the earth has yielded to the demands of King Pṛthu. It has been made even and symbolically raised to a new level. The levelling of the earth as a rite is an execution of the First King's insistence that order should be established in a wild, unruly, and errant world. This is done in turn by the builder of every temple. Once, it is also said in another connexion, the earth itself became level. This took place at the birth of the Buddha who, as

³⁹ Similarly, the axe which is to cut the tree for the sacrificial post is invoked while it is employed: "O axe, hurt it not"; and prior to the fatal blow, a blade of Darbha grass with its point upward is laid on the tree after having uttered the words: "O herb, protect it" (the sacrificial post); (Ś. B., III. 6. 4. 10). Afterwards an offering is made above the cut surface, with the prayer that the tree may grow up again with a hundred branches. ('Āpastamba Śrauta-sūtra', VII. 2. 4. and 8).

⁴⁰ Pṛthivī, earth, the broad one, was perceived first by Prajāpati, the Boar, on a lotus leaf, with the words "now this has come into existence (abhūt)". From this, earth is called 'bhūmi'. ('Taittirīya Brāhmaṇa', I. 1. 3. 5-6; cf. 'Taittirīya Saṃhitā', VI. 2. 6. 3, where that sacrificial site is called 'firm' or established which is even on all sides).

soon as born, stepped forth upon the earth and beneath his steps the earth lay smooth and even, for by his footfalls the Law (dharma) was carried throughout the world and became universal. The levelled earth became its substratum.⁴¹

After the ground is rendered as level as the surface of water or of a mirror it should be made a perfect square ('Hayaśiṛṣapañcarātra', VIII. 136). In practice, the actual size of the square need not necessarily be co-extensive with the site, nor even with the building of the temple. It may however be equal to any one of these or else of a definite size. The 'square field' is a symbol and its meaning remains unchanged if its measure is given as five or eight cubits square.⁴²

The 'Śatapatha Brāhmaṇa' (I. 2.5.7.) explains that the sacrificial ground is called Vēdi because the gods obtained (sam-vid) the entire earth by encompassing the sacrifice on the four sides. The sacrificial ground or altar ground (vēdi) is a symbol of the earth; as large as is the Vēdi so large is the earth.⁴³

The surface of the earth, in traditional Indian cosmology, is regarded as demarcated by sunrise and sunset, by the points where the sun apparently emerges above and sinks below the horizon; by the East and West and also by the North and South points. It is therefore represented by the ideogram or maṇḍala of a square.⁴⁴ The identification of the square with the Vēdi is in shape only and not in size and belongs to the symbolism of the Hindu temple. The Vēdi represents and is the levelled earth, a place of sacrifice or worship: "No part of the ground should rise above it; for it was from there that the gods ascended to heaven" (Ś.B. III. 1.1.1-2). The site, the earth, should be even and firm, for it is the starting place of the ascent (Ś.B. VIII. 5.2.16). The link between the earth and the end of the ascent stretches upward into space, the intermediate region (antarikṣa). From it also it leads downward and rests on earth. In it the temple has its elevation. The Vāstupuruṣamaṇḍala, the temple-diagram and metaphysical plan is laid out on the firm and level ground; it is the intellectual foundation of the building, a forecast of its ascent, and its projection on earth.

⁴¹ P. Mus. 'Barabudur', BÉFEO, vol. XXXIV, p. 210.

⁴² 'Śāradātilaka', ch. III. 3. comm.; quoting 'Mahākapilapañcarātra'; see note 10.

⁴³ RV. I. 164. 35; 'Mādhyandina Samhitā', XIII. 62; Ś. B. III. 7. 2. 1. Vēdi=Prthivī; RV. X. 110. 4; Ait. B. I. 5. 28; Tait. B. I. II. 1. 1; Ś. B. IX. 4. 2. 3; XII. 8. 2. 36.

⁴⁴ The square does not refer to the outline of the earth. It connects the 4 points established by the primary pairs of opposites, the apparent sunrise and sunset points, East and West; and South and North. The earth is therefore called 'caturbhr̥ṣṭi', four cornered (RV. X. 58. 3) and is symbolically shown as Prthivī-maṇḍala, whereas considered in itself, the shape of the earth is circular, RV. X. 89. 4; Ś.B. VII. 1. 1. 37.

II

THE PLAN

उच्छिष्टे नाम रूपं चोच्छिष्टे लोक आहितः ।
उच्छिष्टे इन्द्रश्चाग्निश्च विश्वमन्तः समाहितम् ॥१॥
उच्छिष्टे द्यावापृथिवी विश्वं भूतं समाहितम् ।
आपः समुद्र उच्छिष्टे चन्द्रमा वात आहितः ॥२॥

“Name and Form are in the Residue. The world is in the Residue. Indra and Agni are in the Residue. The Universe is in the Residue. Heaven and Earth, all Existence is in the Residue. The water, the ocean, the moon and the wind are in the Residue.”

‘Atharva Veda’, XI. 9. 1-2.

II

THE PLAN

Prthivī, the element and goddess Earth (bhū), yields her surface; it is the ground (bhūmi) of architecture ritual, as it is the realm of manifestation, and of bodily existence; "it is the place where mortals and immortals reside (vas). The following four are considered as Vāstu, residences, by the ancients who were experts in architecture: Bhūmi, the ground; Prāsāda, the temple or palace, Yāna, the conveyance, and Śayana, the couch. Bhū, the earth, is considered the main Vastu, it is the underlying stratum of existence. Those that originate therefrom, the Prāsādas and other works of architecture are Vāstu (dwelling places, planned sites), because they are Vastu (existing things) and have their support on Vastu (an existing, concretely real thing)" ('Mayamata', II. 1-3a). Of these four classes, Bhū, the earth, is described first in the 'Mayamata', and the other treatises on architecture because "it is the first of the elemental principles (bhūta) and a support for the existence of the world" (ibid. II. 9).¹

Vāstu, is primarily the planned site of the building. Its shape is square as a rule and its full name is Vāstupuruṣamaṇḍala. This name consists of three parts, Vāstu, Puruṣa and Maṇḍala.

Vāstu here, is the extent of Existence in its ordered state and is beheld in the likeness of the Puruṣa. The image of the Supernal or Cosmic Man, the Puruṣa, is congruous and identical to the planned site.

Puruṣa, Cosmic Man, the origin and source of Existence (aparā-prakṛti), is its instrumental or efficient cause (nimitta-kāraṇa) and causes it to be of His substance as its material cause (upādāna). This is how He is known in the world, the manifested aspect of Himself, the Parā-prakṛti, the Beyond-Existence, the Avyaya Puruṣa, the immutable, Supreme One (Uttama-Puruṣa). In his identity with the 'plan', Puruṣa is shown in his conditioned aspect. The plan makes the site of the building in his image which is his form. The plan of the building is in the likeness of the Puruṣa, or of the totality of manifestation.

Maṇḍala denotes any closed polygon. The form of the Vāstupuruṣamaṇḍala is a square. This is its essential form. It can be converted into a triangle, hexagon, octagon and circle of equal area and retain its symbolism ('Bṛhat-Saṃhitā', ch. LII. 56, comm.).

¹ The 5 'bhūtas'—earth, water, fire, air and ether—are the first or lowermost of the 24 principles (tattva) of the world of duality (ātma-tattva).

Vāstu, with long ā is derived from Vastu, with short a.

The relation of the Vāstupuruṣamaṇḍala to the site-plan, ground-plan and vertical section of any building is similar to that of the tonic and any musical composition. The Vāstupuruṣamaṇḍala gives the principle of all planned architectural form and the prototype of its various rhythms. Vāstu-śāstra speaks of Talacchanda or Adhaśchanda, the rhythm of the level and of Ūrdhvacchanda, the rhythm of the elevation implying the proportionate measurement which connects the ground-plan and the vertical section of a building.

The Vāstupuruṣamaṇḍala is the plan of all architectural form of the Hindus. The site-plan, the ground-plan, the horizontal and vertical sections are regulated by its norm. Originally and in practice the site-plan is laid out according to the Vāstupuruṣamaṇḍala; and the 'general form of the temple' (sāmānya prāsāda; Part VII) given in the earlier texts, rests on the Vāstupuruṣamaṇḍala.

SQUARE AND CIRCLE: VEDIC ORIGINS

"The shape of the Vāstu for gods and Brāhmanas is prescribed as square" ('Mayamata', III. 1).² The square is literally the fundamental form of Indian architecture. Baudhāyana's prescription how to make a square (caturaśrīkaraṇa) requires a cord (sūtra) of the desired length of the square, its division in half, fixing of poles in the middle of the east-west line and at the cardinal points, and the drawing of circles from these points with the length, and half the length of the cord respectively as radius. The exterior points of intersection of the four circles about the eastern, southern, western and northern poles with a diameter equal to the length of the cord are the four corners of the required square field.³ The square is the essential and perfect form of Indian architecture. It presupposes the circle and results from it. Expanding energy shapes the circle from the centre; it is established in the shape of the square. The circle and curve belong to life in its growth and movement. The square is the mark of order, of finality to the expanding life, its form; and of perfection beyond life and death.

Square and circle are co-ordinated in the architecture of India from the Vedic Fire altar, Agni. The Fire (Agni) and its support, the altar, are one in name. The 'Śatapatha Brāhmaṇa' and the 'Śulva Sūtras' give the rules for piling up these hearths or altars. In the sacrificial shed (prācīna-vaṃśa-śālā) are three

² Also 'Vāstuvīdhāna' of Nārada (Ms. 1602, Adyar Library), VIII. See Appendix.

³ 'Baudhāyana Śulva Sūtra', I. 22-28. The very same method of constructing the square with the help of circles is prescribed in later texts with reference to the square of the Vāstupuruṣa (for instance, 'Śāradātilaka', III. 6; VI. 3-7), it is similar to the method prescribed in the 'Āpastamba Śulva Sūtra', VIII. 8-10; XI. 1. where a bamboo rod is rotated. The construction of the square by rotation, of rod or cord, is however not the only one. Three further methods are prescribed in the 'Śulva Sūtras' ('Āpastamba Śulva Sūtra', I. 7; 'Baudhāyana Śulva Sūtra', I. 29-35 and 'Āpastamba Śulva Sūtra', I. 2) where the square is constructed by the stretching of the cord only, and without rotation (B. B. Datta, 'The Science of the Śulba', pp. 55-62). See also Part VII.

altars, two of them on the east-west line in the middle, the 'easterly spine' (prācinavaṃśa), and one to the south of the line. Of the two altars on the east-west line, the one at its eastern end is square, the other at its western end is circular. The square one, on which burns the Āhavanīya fire, denotes the heaven (dyau) world; from this celestial fire all other fires are subsequently lighted.⁴ The circular one, the Gārhapatya hearth, denotes this terrestrial world. The third hearth, which is that of the Southern fire, Dakṣiṇāgni, denotes the air-world (Ś. B. XII. 4. 1. 3).⁵

The square Āhavanīya hearth at the eastern end of the sacrificial shed is in the middle of an area, one fathom (vyāma) square. In the Soma sacrifice, the highest of all sacrifices, after the initiation of the sacrificer, the square Āhavanīya hearth makes way on the first Upasad day⁶ for the new brick-built Śālādvārya Gārhapatya which has one fathom square for its area (Ś.B. VII. 1. 1. 37)⁷ and is round in shape.

Outside, to the east of the sacrificial shed, at a given distance a plot is demarcated; this is called the Mahāvedi.⁸ The square High altar, Uttara Vedi, is on its eastern side.⁹ The Uttara Vedi, too, symbolizes the heavenly world (Ś.B. VII. 3. 1. 27). In the centre of the Uttara Vedi is a small square, its 'navel' (nābhi), one span (vitasti) square (Āp.Ś.S. VII. 5. 1).

The square is the shape of the Uttara Vedi, the High altar; it is also the shape of the hearth of the celestial Fire, the Āhavanīya Agni; it is the shape of the centre, the Nābhi, of the Uttara Vedi, and also of the Ukhā, the pan in which the celestial fire is carried from the Āhavanīya Agni.

⁴ The fire is first lighted by friction of wood on the Gārhapatya hearth. From the Gārhapatya the fire is transferred to the Āhavanīya hearth.

⁵ The rules and meaning of the Agni and the Vedi are given in the Brāhmaṇas (c. 2000 B.C.). They form part of the Karmavidhi, the rules for the performance of the sacrificial rites. The Śrauta-Sūtras (2000-1500 B.C.) contain the rules for the rites ordained by the Veda. Each Śrauta-Sūtra seems to have had its Śulva-Sūtra, or section dealing with the measurements and the 'geometry' of the altar.—The Vedi is the sacred ground measured out for the sacrifices (yajña); RV. VIII. 19. 18. In the 'Śatapatha-Brāhmaṇa', VII. 1. 1. 37; VII. 2. 2. 2. ff. are explicit descriptions of the Gārhapatya and Āhavanīya hearths.

⁶ The Upasad days are counted from the commencement to the completion of the altar (Agni).

⁷ S.B.E., Vol. XLIII, p. 307. Vyāma, a fathom, is the distance between the tips of the middle fingers when the arms are stretched out horizontally. This length of a fathom is also the height of man, from the soles to the root of the hair on the forehead, and remains throughout Indian art and symbolism the perfect proportion; cf. Weber, 'Indische Studien', XIII, p. 242.

⁸ The Mahāvedi is a trapezium, its 'prāci' or middle line in the E-W direction measures 36 units ('prakrama' or 'pada', the east side 24 units, the west side 30 units. 1 prakrama = 3 pada: 1 pada = 10 aṅgulas or 15 aṅg. or also 12 aṅg. ('Taitt. Samh.', VI. 2. 4. 5; 'Mānava Śulva Sūtra', ch. IV). The Mahāvedi is also called Saumikī Vedi and is situated in the open to the east of the sacrificial shed (prācinavaṃśaśālā) for the purpose of the Soma sacrifice. The Vedi in the shed, between the three hearths, is rectangular with concave, curved sides (cf. the drawing in S.B.E., vol. XXVI, p. 475 and W. Caland-V. Henry 'L'Agniṣṭoma', I. Pl. IV). Neither of these Vedis is square.

⁹ The Uttara Vedi is the principal—and primary—Vedi.

The Ukhā, the earthen fire pan (Ś.B. VI. 5. 2. 8), has the shape of a cube. It is the earthen 'womb' of the Fire (Agni; Ś.B. VI. 5. 2. 21).¹⁰ In the Soma sacrifice, the celestial sacrificial fire is transferred daily from the Āhavanīya hearth to a seat of Udumbara wood by the sacrificer in an initiation of one year's duration; the fire is transferred in the pan, the Ukhā (Ukhyā Agni) serving as Āhavanīya Agni. On the first day after the initiation, a new round Gārhapatya hearth is built. Its new site is the space of a fathom square in the centre of which was the original square Āhavanīya hearth. The new Gārhapatya hearth (śālādvārya), near the eastern entrance of the sacrificial shed, is built of brick. Its area is equal to one fathom square. It preserves its identity in its name, Gārhapatya, and in its round shape. The domestic fire (Gārhapatya) of the sacrificer has now been transferred to the place of the celestial fire (Āhavanīya) not only by its position but also by its extent. The circle of the Gārhapatya, now situated in the east of the sacrificial shed is equal to a square of one fathom. Its nucleus in the centre is also square.

The Purāṇa Gārhapatya, the old Gārhapatya hearth, was of terrestrial nature. This now, at the completion of the initiation, is commuted in the Śālādvārya Gārhapatya, to its celestial nature and destination.

The centre of the new Gārhapatya hearth is laid out in the shape of a cross : four large rectangular (2 'pada' by 1 'pada' each; double square) bricks, in one line from North to South, to which are added two bricks at the back and two in front (1 square pada each), that is West and East; these four bricks are half the size of those North to South. To these are added further bricks which fill the corners in the intermediate directions of the square area inside the round Gārhapatya hearth. To these, further bricks are added; they fill the round periphery with its 21 enclosing bricks (Ś.B. VII. 1. 1. 17-19). The new Gārhapatya hearth has the shape of a circle equal in area to a square fathom (vyāma=a man's length).

Each kind of sacrifice requires an Agni (altar) of prescribed shape (and size). Sacrifices are (1) obligatory, daily or seasonal and (2) undertaken for the purpose of wish fulfilment.

The main altars for the daily (nitya) sacrifices are the Āhavanīya, Gārhapatya and Dakṣiṇa. Amongst the seasonal or recurrent sacrifices, the Soma sacrifice necessitates a Vedi=altar-ground, outside the sacrificial shed, the Mahāvedi or Saumiki Vedi, and on it, the Uttara Vedi, and a Fire Altar (Agni). Their construction, form and meaning as well as those of the abovementioned hearths, are fundamentally important to the Hindu temple. The Soma sacrifice entails the building of the Agni, the Fire Altar, which is piled above the Uttara Vedi on the Mahāvedi. This rite is called Agnicayana, the piling of the Fire Altar. The 'Satapatha Brāhmaṇa' gives its rules and meaning. This big sacrifice must be performed in a Vedic Hindu family at least once in three generations.

The brick-built Gārhapatya altar is proper to the Soma-sacrifice. Weber, l.c. Vol. XIII, p. 242.

About the Kāmya Agnis, the fire altars of different shapes for sacrifices performed with the purpose of attaining definite objects, see Thibaut, 'On the Śulva Sūtras', JASB., 1875; and N. K. Majumder, 'Sacrificial Altars: Vedis and Agnis', JISOA, Vols. VII and VIII; the one of falcon shape (catuśśra-śyena citi) is the most relevant. The Kāmya Agnis are not directly related to the Hindu Temple.

¹⁰ The Ukhā is burnt with fire of the Dakṣiṇāgni, or with newly made fire. Weber, op. cit., vol. XIII, p. 225 f.

"The Gārhapatya is this (terrestrial world) and this world is circular" (Ś.B. VII. 1. 1. 37). The earth as the terrestrial world, in Vedic tradition, is symbolised by the circle, and by the round Gārhapatya hearth in contradistinction to the square of the Āhavanīya hearth which stands for the heaven world. During the year of initiation the round hearth of the earthly fire is re-built, at the place of the celestial fire and to the extent of its square site. In this architectural rite it is transferred to another place where it is identical, by measure and position, though not outwardly by shape, to the site of the altar of the celestial fire. Agni is the name of the Fire wherever it burns and the altar, Agni, is its support, terrestrial or celestial, according to its shape.

The Vēdi, in Vedic tradition, represents the extent of the earth. It is an area for sacrificial purposes. The shape of the Vēdi varies. It is symbolical as a delimited area and not as a definite figure. The Uttaravedi is square and it is said: "the Vēdi is the earth, the Uttaravedi the heaven world" (Ś.B. VII. 3. 1. 27). This is its symbolic value by virtue of its squareness.

In the Hindu temple, it is the square Vēdi which makes the sacred ground. The circular aspect of the earth is left behind, it belongs to the world of appearance and its movement; the earth is beheld itself under the perfection of the heavenly world and, knowing this perfection, is drawn as a square.¹¹

On the last day of the initiation (dikṣā), the Mahāvedī is measured and demarcated and on it the area of the Fire altar which is to be built, so that the fire in the Ukhā can finally be deposited on it, having been brought from the new Gārhapatya (śālādvārya). Of the Agni now to be built, first the body (ātman) is thrown up on the Mahāvedī, the altar ground, which has been ploughed and sown during the introductory sacrifice (prāyaṇīyam) on the day following the last day of the initiation. The Agni lies symmetrically on the East-West line, the middle line or spine of the Mahāvedī, close to its east side ('Kātyāyana Śrauta Sūtra' XVI. 7. 31). The body (ātman) of the altar is laid out square. "Agni piled up for the first time should be without wings and tail and measure one square 'puruṣa'. A bamboo rod is the measure; it measures the length of the sacrificer when he stretches up his arms". (Āp.Ś.S. XVI. 17. 8-10). It is also laid down that the body (ātman) of the bird-shaped Agni has an area of 40 square feet (pada) or 4 men's length (puruṣa) square in an area of 7 men's length square (sapta-puruṣa).¹² "With man's measure he (the sacrificer) metes out. Man is commen-

¹¹ Under this aspect the earth is known in RV. X. 58. 3 (caturbhr̥ṣṭi); VII. 99. 1 (catuśrakti); Ś. B. VI. 1. 2. 29 (catuśrakti). On this knowledge are based the square maṇḍala of the earth, Pṛthivīmaṇḍala, and the square Vāstupuruṣamaṇḍala of the Hindu temple (see Part I).

¹² Of the bird-shaped Agni it is said (Ś. B. VI. 1. 2. 36). "For what object is this fire (altar) built? 'Having become a bird, he (Agni) shall bear me to the sky', so say some; but let him not think so; for by assuming that form, the seven breaths [(prāṇa) in the sense of the Greek 'pneuma'] became Prajāpati" (cf. VI. 1. 1. 5-6); "by assuming that form Prajāpati created the gods; by assuming that form the gods became immortal: and what thereby the immanent breaths and Prajāpati, and the gods became, that indeed he (the sacrificer) thereby becomes" (trans. Eggeling, S.B.E. XLI).

One 'puruṣa' is the length of man standing on tiptoe (or not) with raised arms; it measures 5 'aratni' (the length from the elbow to the tip of the little finger, an ell) or 'hasta', the distance between the elbow and the tip of the middle finger, or 10 'padavitasti' (span);

surate with the sacrifice." (Taitt. Samh. V. 2. 5. 1). "As much as a man with arms extended, with so much a bamboo rod (the Fire altar) is meted out" ('Maitrāyaṇīya S.' III. 2. 4). He metes it out with (the measure of) man (puruṣa) with arms extended. "Verily the sacrifice is a 'puruṣa' and hence by it, all these are measured, and that is its best measure inasmuch as with arms extended he (man) has his maximum measure" (Ś.B. X. 2. 2. 6.). Man in his maximum measure is the standard of measuring the Agnikṣetra, the square field of the Agni.

The square Ātman within the Agnikṣetra has two spines (vaṁśa, prṣṭhya); the main one, in the East-West direction coincides with the middle line of the Mahāvedi; the other cuts across it at a right angle.¹³ Where the middle lines meet the sides of the square 'body' an earthen brick (logeṣṭakā) is laid down on each side. From the point, which is to be the centre of the Ātman and of the Agnikṣetra and where a bundle of Kuśa grass has been placed, the Uttara-Vedi is now thrown up, a square mound or platform.¹⁴ The earth for it has been taken from a square pit (cātvāla) of the same content. Its height is made equal to that of the earth bricks in the middle of the sides of the body (ātman) of the Fire altar. The remaining area of the Ātman is then filled up (with sand) to the same height. The Uttara-Vedi, the High altar, is made part of the first layer (citi) of the Fire altar. The 4 earth-bricks and the Kuśa grass bundle in the centre are counted as 5 'bricks' of this first layer (Ś. B. X. 4. 3. 14).

The Navel (nābhi) in the centre of the Uttara-Vedi, the High altar, is square and measures a span;¹⁵ it is the centre of the sacrifice. There, originally, the fire was laid and it is here that the symbolism of the square has its root in the Vedic rites.¹⁶ The Ukhā, the fire-pan made of clay, in which the Fire (Agni) is carried from the Āhavanīya hearth, to the Agni, the Fire altar, piled above the Uttara-

Weber, l.c. p. 239. These are relative measures; they vary with the height of the sacrificer. The cubit 'hasta'=2 'padas'=24 aṅgulas is the generally accepted unit in Hindu architecture.

A 'puruṣa' is the measure of man with arms raised. Vyāma, the measure of man from the soles to the root of the hair on the forehead, is equal to one fathom. The latter is the standard of measure for the altars of the daily sacrifices. The Agni of the Soma-sacrifice is measured with man's greatest measure.

The length of a 'puruṣa' is standardised as 120 aṅgulas. Aṅgula is the width of a finger, i.e., the thumb (see Part V). A Vyāma has 120 or else 96 aṅgulas. Generally however 'puruṣa' and Vyāma denote a length of 120 aṅgulas. This explanation is given in the commentary by Bhaṭṭabhāskara Miśra of the 'Taittirīya Saṃhitā' (Mysore Oriental Library series, Bibl. Sanskr., No. 15, pp. 134-136). The 'Samarāṅgaṇasūtradhāra', IX. 45, however, gives 84 aṅgulas as equal to 'vyāma=puruṣa'. Re: the different types of aṅgula, see Part V.

¹³ The Agnikṣetra, the complete extent of the Fire altar, has 95 increasing sizes, the area of each being increased by one-seventh of the original size (1 square puruṣa); Weber, l.c. p. 240.

¹⁴ The measurement of the Uttara-Vedi is given in Ś. B. VII. 3. 1. 27; cf. also 'L'Agniṣṭoma', op. cit., I. p. 75.

¹⁵ Prādeśa, or it has the length of a bull's foot or a horse's foot ('Āpastamba Ś. S.' VII. 5. 1).

¹⁶ K. F. Johansson, 'Die Altindische Götter Dhiṣaṇā', p. 51, speaks of the Uttara Vedi as more ancient than the Vedi of the Prācīnavamśa.—The sacrifice itself is called 'bhuvanasya nābhiḥ', RV. I. 164. 34.

Vedi, is necessarily square in section; it measures a span as does the Nābhi. It is spoken of as the womb, and its cube holds the entire manifested universe, its under surface being this world; the lower part of its sides is the air; the upper portion is the sky (Ś. B. VI. 5. 2. 22). This womb of Agni survives its name and retains its function and to some extent its form in the shape of the Phelā, which is the 'womb' of the temple (Pt. IV), and also in the Garbhagrha, the 'womb chamber' of the Embryo, or innermost sanctuary of the temple. It also is generally built on a square plan and is cubical. The navel and womb as places of generation and continuity are images which endure. They are fitted into the square, not in any way as visual symbols, but in virtue of their function, the one accommodating the celestial Fire and the other the Garbhagrha with the image or symbol of God.

The square, as fundamental figure of sacrificial symbolism and temple architecture, lends itself to many variations. Baudhāyana prescribes the construction of the Sārārathacakraṇit and the commentator explains how to form at first a small square with 4 bricks in the middle of the Agnikṣetra then to enlarge this square, to one of 16, etc. This method has become known in the West, through Aristotle, as the Pythagorean 'gnomon'.¹⁷ It is in this way too, that the various types of the Vāstumaṇḍala are enumerated in Vāstusāstra in a progressive series of 1, 2, 3, 4 units square, etc., the most sacred being the plan of 64 squares, preserving the meaning of 64 which is exemplified in "64 bricks form the spokes of the wheel, 64 the Vedi."¹⁸

In general a brick in the Brāhmaṇas is one foot square, or its multiple or sub-multiple.¹⁹ It is a natural unit and its name 'iṣṭakā', which denotes a brick, has remained the name of any building 'stone'.

The description of the Gārhapatya (śālādvārya) as a circle equal in area to the square of one fathom is given in the 'Śatapatha Brāhmaṇa' (VII. I. I. 37).²⁰

¹⁷ G. Thibaut, 'On the Śulva Sūtras', JASB., 1875, p. 200 f.; T. L. Heath, 'History of Greek Mathematics', Vol. I. p. 77.

¹⁸ G. Thibaut, l.c. quoting 'Baudhāyana Śulva Sūtra', III, with reference to the Sārārathacakraṇit. In this particular instance, three consecutive squares are constructed. The central one of 16 squares for the nave, that of 64 squares for the interior edge of the felloe, and the third square as its outer edge. These squares are then turned into circles.

The Vāstumaṇḍala of 64 squares is, according to Varāhamihira, prescribed for the temple ('Bṛhat Saṃhitā', LV. 10; cf. Part I). It is its original plan. Utpala, however, commenting on LII, 73, admits the Vāstumaṇḍala of 81 squares for all kinds of temples, regulating the rhythmical disposition of their ground-plan (adhaśchanda, talacchanda), etc., whereas palaces, etc., must have a Vāstumaṇḍala of 81 squares.—The royal maṇḍala, it appears, is thus admitted and established in the sacerdotal field.

¹⁹ Ś.B. VIII. 7. 2. 17. prescribes one foot square. The bricks are classified as 'padya, ardhapadya, padabhāga' according to their side length of one foot, a half and a quarter foot respectively (Weber, l.c.); the 4 bricks which form the 'body' of the Gārhapatya hearth are rectangular, twice the length of the square bricks laid at the front and back, east and west; Ś.B. VII. 1. 1. 18. This makes the centre of the round Gārhapatya hearth a square (p. 253).

According to Āp. Ś.S., XVI. 13. 6. bricks may also measure one 'aratni' or ell, or the length of the thigh or the upper spine. The unit of the measure of the sacrificial body which the sacrificer builds up for himself is always taken from his physical body.

²⁰ In the 'Śulva Sūtras' various (approximate) methods are given for the circling of the square and the squaring of the circle. That for circling the square is identical in the various

The square shape of the Āhavanīya hearth, of the Uttara Vedi and the other sacred centres and objects cannot as an alternative be circular; whereas the Gārhapatya, fundamentally circular, may be set up on a square or circular area according to one or the other school.²¹ That is, the 'earth' may be thought of as round, in its own shape or square in its figure ordered by the law of the 'heaven world'.

Because it is the perfect shape the square is sacred in the hierarchy of Indian architectural symbolism; the square is of greater significance than the circle.

Sūtras; whereas alternative methods are given in the Sūtras for squaring the circle. The circling of the square is described and its various methods are given in translation by B. B. Datta, op. cit. pp. 140-149, from the Śulva Sūtras of Āpastamba, Kātyāyana, and Baudhāyana.

²¹ Āp. Ś.S. XVI. 14. 1, and elsewhere. Similarly too, the Dhiṣṇya hearths are piled on a square or circular (base); Āp. Ś.S. XVII. 21. 5.—Analogously, the funeral mound (śmaśāna) is either square or round. Ś.B. XIII; 8. 1. 5. See also Caland, 'Die Altindischen Todten und Bestattungsgebräuche', p. 141.

THE SQUARE MAṆḌALA OF THE EARTH AND OF THE ECLIPTIC

The earth is round. The Brāhmaṇas repeatedly say that the whole earth, once floating and mobile remained in this condition until the cardinal points, becoming fixed themselves, also fixed the earth. In its fixed position it is spoken of as four-cornered (*caturbhr̥ṣṭi*; RV. X. 58. 3) or four pointed (*catussrakti*, Ś.B. VI. 1. 2. 29). These points are where heaven and earth seem to meet, where the sun appears to rise and set; East and West, and the other cardinal points complete the square. The earth, in its contact with heaven of which the sky is the figure, is kept in position by this contact, by the regular appearance and disappearance of the sun, at these points, which are the seal on the marriage of heaven and earth then contracted. The four cardinal points, the four orients, are beheld periodically and become known as perpetually recurring, permanent in a cyclical sense, by which the days are measured and time. In Indian symbolism, the earth, fixed and ruled over by time, is known as, and correspondingly drawn as, four-cornered, each side of the square ruled over by the regent of the cardinal point situated at its middle. Whereas the earth, as the surface of this world which supports the movements and weight of our bodies, is round, the earth held in the embrace of the sky and subject to its laws is represented as fixed four-fold. The Pṛthivī-maṇḍala, therefore, is a square maṇḍala or cakra ('Vāstuvīdhāna', 1. c.).

Thirty-two divinities are assigned to the outermost border of the square Vāstumāṇḍala (Fig. on p. 32). The number 32, geometrically, results from a repeated division of the border of the square. It denotes four times 8 positions in space. The original value of 4 in space are the four directions, 8 are the cardinal points and the corners of the square in the intermediate directions. This is the natural division of the border of the square. The 8 directions are held by 8 Vāstupuruṣas, each having his name and position. These 8 are their visualized potencies within the total Vāstupuruṣa; they are each associated with one of the planets and also with one of the leading stars of eight of the Nakṣatras or houses of the moon.²²

Born from the contact of heaven and earth, brought about by the apparent movement of the sun, the eight directions are presided over each by a planet and its regent. Their terrestrial powers in space are determined by celestial powers in time.

The square, with reference to the level of the earth, is the graph of the pair of opposites initially marked by sunrise and sunset and caused by the daily apparent movement of the sun. These successive and recurrent critical moments are given a permanence by the symbol of the square on which they are shown stationed opposite one another. The balance of their positions is made conclusive

²² The 'Matsyapurāṇa', ch. XCIII, 10-16, moreover distinguishes between the regents (*adhidevatā*) and the secondary presiding divinities (*pratyadhidevatā*) of the planets, etc.

by marking the South and North points as the second corresponding pair of opposites and by connecting these points by straight lines; where they meet at right angles, are the intermediate directions North-East, South-East and so forth, so that by a geometrically progressive series the original two points engender four and eight, sixteen and thirty-two. These stations are marked along the outline of the square diagram; 32 divinities are assigned to the 32 fields in the outer border of the square (Fig. on p. 32). A cyclical sequence is held in the square by the pairs of opposites. They encompass all manifestation, in terms of space, as it is beheld on the level of the earth. This initial translation of the rhythm of time into a pattern in space forms the basis of larger cycles than that of the day; they also are supported by the square drawn on the ground.

Over the 8 Vāstupuruṣas, over the eight points of the compass, preside the regents of the planets and each Vāstupuruṣa has his star²³ (chart on page 38). The planets, Jupiter, Mercury, Mars and Saturn rule over the four points of the compass with reference to the Ecliptic.²⁴

The Ecliptic, the great circle on the apparent sphere of the sky which the sun and the moon seem to traverse, has its symbol in the square Vāstumaṇḍala. The square compass of the directions symbolises at the same time the apparent daily movement of the sun and the apparent monthly and annual movements of the moon and the sun. The former is shown by the lunar mansions, the Nakṣatras, whereas the signs of the Zodiac are not entered in the Vāstumaṇḍala.

The Ecliptic is drawn in India as a square and this coincides in the Vāstumaṇḍala with the square compass of the orients and all directions. The square symbol of the Ecliptic represents the different cycles and the enclosures in space that are separately traversed by the celestial bodies and also the number of units of time taken by the bodies in traversing such an enclosure.²⁵ At present in Indian astrology, the Ecliptic is drawn under the name of Rāśi-cakra, the wheel, a closed polygon, of signs, as a square Zodiac. The astrologer bases his calculations and predictions on this square of which he divides each side into four. The position of the heavenly bodies is represented by him on the ground by a

²³ The 8 Vāstupuruṣas are called by the following names in the 'Bṛhat Saṃhitā', commentary of the 10th century, and the 'Vāsturājavallabha' of the 15th century: Wilderness or Crow, Flag, Crow or Smoke, Lion, Dog, Bull, Monkey and Elephant. These are place marks indicative of the favourable potencies or the auspiciousness of a particular direction. They represent a chthonic correspondence to the eight directions of space and belong to a tradition different from that of the one and comprehensive Vāstupuruṣa, in whose diagram they come to have their place. Utpala speaks about them as forming part of the knowledge of 'other Ācāryas' then Varāhamihira.

²⁴ Mus, 'Barabudur', BÉFEO, XXXII, p. 420. The East, however, (chart on p. 38) is presided by the Moon, and Mercury (Budha) is assigned to the South-West.

²⁵ The 'Sūryaprajñapti' (G. Thibaut, 'On the Sūryaprajñapti', JASB, Vol. 49, pt. I, p. 117) and the Purāṇas explain 3 different motions of the sun: (1) the daily motion. The sun seems to approach from the east, passes through our field of vision, disappears in the west; (2) the annual motion. The sun seems to pass in the course of a year through the circle of the Nakṣatras, proceeding from west to east. (3) The motion in declension. The sun ascends towards the north during one half of the year and descends towards the south during the other half.

sub-division and bordering of the square, the four squares in the centre being obliterated. The 12 signs of the Zodiac are assigned to the 12 squares of the border.²⁶ The 12 signs of the Zodiac are identical in number to the 12 Ādityas who are the different manifestations of the one Sun god in the 12 stages of his journey.

In the Vāstumāṇḍala on which all architecture rests, the border of the square cycle of the Ecliptic is not sub-divided into 12, but into 32 units. This original number of the symbolism of space accommodates, within the border of the square of the Ecliptic, the "32 Nakṣatras".²⁷

The Nakṣatras are the constellations or lunar mansions through which the moon passes in his monthly course. They are a scale of 27 or 28 divisions, capable of representing time intervals as well as spaces. Each Nakṣatra has a leading star and is presided over and sacred to a particular divinity. The 27 and 28 divisions of the Ecliptic become fixed in position like a great, fixed, square dial with the numbers ranging not along the Equator, but along the Ecliptic itself.²⁸ The square, cycle of the Ecliptic, would thus have to be sub-divided into 27 or 28 compartments. Instead of this, the number of Nakṣatras is augmented to 32, so that each field of the border represents a lunar mansion or Nakṣatra. In the Vāstumāṇḍala their number is thus adjusted to the helio-planetary cosmogram²⁹ of the Pṛthivīmaṇḍala. There, the four cardinal points, with reference to the Ecliptic are the equinoxial and solstitial points in the annual cycle. The solar cycles of the days and years are shown in the Vāstumāṇḍala together with the lunations, the monthly revolutions of the moon round the earth. The solar-spatial symbolism is primary and the lunar symbolism is accommodated within the Vāstu-diagram.

The square 'cakra' or maṇḍala is a closed polygon symbolical of recurrent cycles of time. Pṛthivīmaṇḍala, and Vāstu-maṇḍala are both squares; the one connotes the earth ruled in its life by the apparent movement of the sun and filled in its extent by the equilibrium of the pairs of opposites on which this order is established. In its whole extent it is a Vēdi, and this is also true of the Vāstumāṇḍala into which it is incorporated. In the form in which the Vāstumāṇḍala is the 'plan' of the temple and regulates the rhythms of its groundplan (adhaśchanda, talacchanda) a further accentuation of its squareness is the rule. In the sub-division of its sides or borders from four to eight and up to thirty-two, the original geometrical progression, fixing positions, can be seen at work. The 32 positions, four times eight in space, are held by divinities identified with those of the mansions of the moon, by some schools. The border in its continuity is associated with the course of the moon, and inasmuch as it faces the eight directions it is associated with the stations of the sun.

The Vāstu had come to be the place of the adjustment of solar and lunar cycles. The number 32 of the divinities residing in the squares of the border of the Vāstumāṇḍala is also the sum of 4 and 28, the number of the regents of the

²⁶ C. P. S. Menon, 'Early Astronomy and Cosmology', p. 36.

²⁷ The 'Viṣṇudharmottara', Pt. II, ch. XXIX, 24, speaks of 32 Nakṣatras.

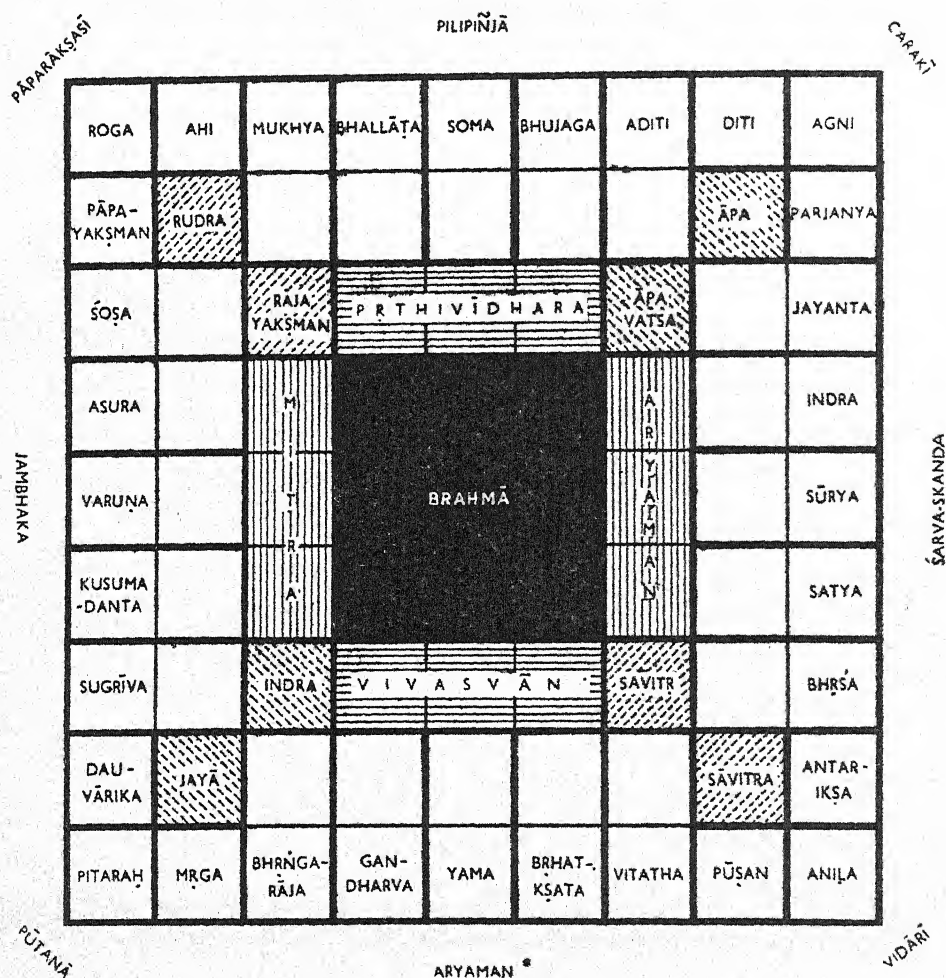

²⁸ Cf. W. Brennand, 'Hindu Astronomy', p. 39.

THE HINDU TEMPLE

four planets who rule over the equinoxial and solstitial points referred to the cardinal points, and of the regents of the 28 Nakṣatras. Their location in the Vāstumaṇḍala shows a reconciliation of the motions of the Sun and the Moon, and they have their nature in their number which is 32; the single divinities who make up this sum act each as a 'locum tenens'. In Vāstusāstra they are nearly unanimously identified with the divinities whose names are shown in the border of the Figure below, following the 'Bṛhatsaṃhitā, LII. 43 f.

VĀSTUPURUṢAMAṆḌALA

The identification of the Nakṣatras with the 32 gods, who are designated as Padadevatās, divinities of whom each occupies a square of the outer border of the maṇḍala, is made in the 'Viṣṇudharmottara', Pt. II. ch. XXIX. 18-30. There the names of the gods are listed, four in each of the directions and four in the intermediate directions. Then follows, according to the text, the list of the "stars". These are enumerated in groups of eight, in the four directions. Their names are almost in every instance identical to those of the Padadevatās; they are not

the names of stars, and only roughly correspond in their positions in the Vāstumāṇḍala with the presiding divinities of the stars (cf. Fig. on p. 32 and chart on p. 34).

Agni, amongst the gods, is assigned the SE; Agni, amongst the presiding divinities of the stars, is assigned the NE. The latter position he holds in the Vāstumāṇḍala of the 'Bṛhat Saṃhitā' as Padadevatā (Fig. on p. 32). The former position however is assigned to him in most of the later texts, where Īśāna rules over the North-East.³⁰ From this it appears that the star gods form the one, and presumably the more ancient, series in the border of the Vāstumāṇḍala; the Padadevatās are but loosely connected with the stars and their special significance is given in detail in the 'Samarāṅgaṇasūtradhāra' of the early eleventh century (Part III).

The number of the Nakṣatras, the 'stars', is 27 or 28. The latter is the number of squares in the outer border of a Vāstumāṇḍala of 64 squares. The astronomically, unsubstantiated increase of their number to 32 appears motivated in two ways. It makes them identical in number and therefore in substance with the 32 Padadevatās; and this assigns to each divinity a full square in the marginal border of a Vāstumāṇḍala of 81 squares. Geometrically, the maṇḍala of 81 squares is a logical form of the proliferation of the 2, 4 and 8, directions; in a series they progress to 16, 32 and 64; in the ritual diagram of the architect, however, the 32 gods find each their unbroken place in the border of the square of 81 units whereas in the square of 64 units the squares in the corners have to be halved so that all the Padadevatās are accommodated in its border. These two varieties of the Vāstupuruṣamaṇḍala, the one of 64, the other of 81 squares are its two main types that underlie sacred architecture.

The elaboration of the Vāstumāṇḍala, the square dial of all cyclical time, and its identification with the Vāstupuruṣa, according to his legend, appear almost completed at the age of the 'Bṛhatsaṃhitā' and the 'Viṣṇudharmottara'. Only a few traces like the double list of the 'Viṣṇudharmottara', or the number 32 as

³⁰ But for this and the corresponding changes in the intermediate directions, where Agni occupies the South-East in the place of Anila; and Anila who is Māruta who is Vāyu, the Wind, is placed in the North-Western corner, there are no major differences in the positions of the Devatās in the Vāstu of all the schools and at all times. Roga (disease) in the later Vāstu-śāstra is ousted from his position and disappears from the Vāstu, while Pāpayakṣman and Śoṣa remain in the retinue of Varuṇa; their evil presence suffices. In the inner border Rājayakṣman (consumption) is replaced by Rudrajaya, in the later texts, and Nirṛti occupies the South-West corner. The other divinities remain the same under identical or else alternate names or synonyms (Bhujaga, for instance, in the 'Bṛhat Saṃhitā', is Kuvera in the 'Viṣṇudharmottara' and the other texts; Agni is Śikhin, Śikhā or Anala, in the Br. S. LII. 43 and Comm.).

* When Aryaman, east of the Brahmasthāna is replaced by Marīci, as in the 'Īśānaśivagurudevapaddhati', III. ch. XXVII. 4-7, his name appears in the South outside the Vāstu. The entities stationed outside the Vāstu, who occupy positions but of no definite extent, are also mentioned in the early texts ('Bṛhat Saṃhitā', LII. 82, etc.). They figure in the 'Īśānaśivagurudevapaddhati', 'Samarāṅgaṇasūtradhāra', etc. (see Part III) and their names are added on p. 32 to the Vāstumāṇḍala of the 'Bṛhat Saṃhitā', for the sake of completeness. The Devatās and their identifications are given in the 'Samarāṅgaṇasūtradhāra' (see Part III, where also drawings are given of the most frequent versions of the two main types of the Vāstupuruṣamaṇḍala of temples).

THE HINDU TEMPLE

that of the Nakṣatras given by Utpala, commenting on the 'Bṛhat Saṃhitā', remain of the various traditions which met in the Vāstu.

Utpala, commenting on 'Bṛhat Saṃhitā', LII. 73, gives the position of the Stars and their presiding divinities, in the border of the Vāstumāṇḍala as follows :

THE STARS AND THEIR REGENTS IN THE BORDER OF THE VĀSTU RULING OVER THE POSITIONS OF THE ENTRANCE³¹

E	Kṛttikā 3 Agni	Uttarā- phalgunī 12 Bhaga	Jyēṣṭhā 18 Indra	Viśākhā 16 Indra- Agni	Punarvasu 7 Aditi	Tiṣya 8 Bṛhaspati	Hastā 13 Sūrya	Ārdrā 6 Rudra
S	Citrā 14 Indra	Viśākhā 16 Indra- Agni	Revatī 27 Pūṣan	Mūlā 19 Nirṛti; Rākṣasa	Bharanī 2 Yama	Uttarā- śādhā 21 Viśvedevāḥ	Aśvinī 1 Aśvinī	Anurādhā 17 Mitra
W	Maghā 10 Pitarah	Prausṭha- pada 25 Ajapād	Pūrva- phalgunī 11 Aryaman	Pūrvāśā- dhā 20 Varuṇa	Viśākhā 16 Śakra- Agni	Śatabhiṣaj 24 Varuṇa	Aśvinī 1 Aśvinī	Revatī 27 Savitṛ
N	Svāti 15 Vāyu	Āśleṣā 9 Sarpa	Abhijit 7 Brahmā	Mṛga- śiras 5 Soma	Śravaṇā 22 Viṣṇu	Dhaniṣṭhā 23 8 Vasus	Bharanī 2 Yama	Rohiṇī 7 Brahmā

The entrance to a building or settlement or else the position of a building on the site-plan is favourable, brings good luck to the builder, at certain of the 32 positions, and ill luck of various kinds, at others. If the moon and the stars are favourable, then only should a building, on a site, or the entrance to site or building be placed in that position. These astrological and other considerations are specially applicable to domestic architecture, whereas the positions and directions of temples depend on further observances (Pt. VII).

The knowledge of the Vāstupuruṣamāṇḍala which implies the settling and forming (vikalpana) of the Vāstupuruṣa is the first limb of the body of Hindu

³¹ The above chart shows for each of the four directions, the names of eight lunar mansions, in the first line ; the numbers in the second line belong to the mansions in the sequence in which the moon enters them. The third line gives the name of the presiding divinity of each Nakṣatra (star). The chart is drawn up according to Utpala, l.c., and its lacunae are filled from the 'Taittiriya Saṃhitā', IV. 4. 10, and the 'Bṛhatpārāśarahr̥'.
The names of 27 Nakṣatras are given while the number of entrances or their positions is 32. Certain stars therefore are repeated, Viśākhā appears thrice, and Revatī, Bharanī and Aśvinī twice each.

The position of the Nakṣatras does not agree with the relative situation of the principal stars, in the 'Sūrya Siddhānta'. E: Rohiṇī, Āśleṣā, Mūlā. S: Bharanī, Kṛttikā, Maghā, Revatī. W: Hastā, Dhaniṣṭhā. N: Aśvinī, Mṛgaśiras, Pūrva-Phalgunī, Viśākhā, Pūrva-Āśādhā, Uttara-Āśādhā, Pūrva-Bhādrapada, Uttara-Bhādrapada. Middle: Pūṣya (Tiṣya), Anurādhā, Jyēṣṭhā, Śravaṇā.

architecture ('Samarāṅgaṇasūtradhāra', XLV. 2); it is a prerequisite of all architectural work, sacred and domestic.

In the Vāstumāṇḍala, the eight directions of space are held by eight Vāstupuruṣas; over these preside the regents of the 8 planets and 8 divinities of the Nakṣatras. Its square thus houses the daily apparent movement of the sun by which are determined the 2, 4 and 8 directions of space; it houses also the annual movement of the sun, when the points of the compass are taken to refer to the Écliptic, and are presided over by the regents of the planets; and also the course of the moon on the Ecliptic and its passage through the lunar mansions.

The regents of the planets and of the stars rule over the destinies of men. The particular lunar mansions and lunar days have their presiding gods. They are the powers which rule over the Nakṣatras and over the actions of men and their results on these days, the good or evil which they shall bring to man. The house and the life of the builder or donor, are connected and their fate is determined by the stars. The connection of man, his work and the cosmos, in the cycles of time is verified in the Vāstumāṇḍala of which the entire extent is covered by the one and only Vāstupuruṣa whose legend is told in many versions and whose body is occupied by 45 Vedic gods. It is this complete Vāstupuruṣa congruous to his magic diagram, which forms the basis of Indian architecture. Its square is symbolical of all cyclical time, the day, the month, the year and the wider cycles marked by the recurrence of eclipses.

The 32 gods of the outer border, surround, and have their centre in Brahmā. Along with Brahmā, their number is 33, the number of the gods in the Āpri hymns of the Ṛg Veda. In addition to these 33 gods, 12 more gods are stationed in the square, magic diagram of the Vāstumāṇḍala; they correspond to the 12 Ādityas, the sons of Aditi. Either of these series of gods are the Lords of a completed cycle of eclipses; at the end of an eclipse cycle the motions of the sun and moon are adjusted.³² Dhātar, the Creator, sets sun and moon in the same position as before (RV. X. 190. 1-3), and the time world goes on.³³

The Vāstumāṇḍala with its border is the place in which the motions of Sun and Moon are reconciled and where their union takes place. It is the Vāstu in which the decrepit, old Cyavana asked his sons, to put him down so that he would become young again. Cyavana, the aged decrepit (RV. I. 116. 10) whose story has several versions in the Brāhmaṇas and Purāṇas, though always of the same meaning, is the Moon and Sukanyā, 'the lovely maiden' whom he desires, is the Sun. The 'Jaiminiya' or 'Talavakāra Brāhmaṇa' says³⁴: "Cyavana, the Bhārgava knew the Brāhmaṇa of Vāstupa. He said to his sons: I know the Brāhmaṇa of Vāstupa, put me down then in the Vāstu and go forth . . . They went forth . . . He, left in the Vāstu, wished 'may I be young again . . . May I

³² R. Shamasastri, 'The World-cycle', JISOA, vol. XI, p. 117.

³³ ib. p. 118; The number of the Ādityas is 8 in the Ṛg Veda.

³⁴ Extracts, translation revised from the original, III. 120-128; W. Caland, 'Das Jaiminiya Brāhmaṇa in Auswahl'; p. 251. Vāstupa or Vāstoṣpati is Rudra ('Taittirīya Saṃhitā', III. 4. 10. 4).

win a girl for wife. May I sacrifice with a thousand cows'; he saw this Sāman;³⁵ he praised with it; when he had praised, Śaryāta, the Mānava³⁶ with his clan, settled down (*adhyavāsyat*) by him. The young cowherds smeared him with dirt he wrought discord for the Śaryātas; then neither did mother know son, nor son mother. Śaryāta, the Mānava, said: Have ye seen anything here which could have brought this about? They said to him: surely there lies below here this worn out old man; him the young cowherds and shepherds to-day have been smearing with dirt—hence this has become thus. He said: That verily was Cyavana, the Bhārgava; he knows the Brāhmaṇa of Vāstupa, him now his sons have left in the Vāstu and have gone forth. Running up to him, he said: Sage, homage to thee: have mercy Sir, on the Śaryātas. Now there was a beautiful daughter of Śaryāta, Sukanyā. He said: Do you give me Sukanyā! Sure I know the Brāhmaṇa of Vāstupa; put her down here by me and then go with your clan this very day at evening." They gave her to him. Then Cyavana, the Bhārgava having praised with this chant and become young again, his youth restored by the union with the Sun, grows from crescent to full moon.

The union of Sun and Moon on the new moon day is known as the cause of creation (*ṛtu*) of every form of life in the world. On a new moon day, the moon enters the sun ('Jaiminiya Upaniṣad Brāhmaṇa', I. 13. 6.). The Vāstu is the site where this union takes place, and goes on taking place so long as existence (*vastu*) continues. It is moreover not only the place of this particular union of the Sun and Moon but also of the larger cyclical celebrations which occur at recurrent eclipses.

The lesser cycles of days, months and years, run their course within the *Adhisamvatsara*, the Great Year. It is made up of 33 eclipses. The same eclipse that marks the beginning of the cycle reappears at its end, when the Sun and the Moon are set together aright as before and begin their races and the Moon will gain one year over the Sun and come in conjunction with the latter at the close of the cycle. Then the creation of the time world begins again and goes on in ever renewed cycles.³⁷

The eclipse is imaged as Rāhu. His name is added to those of the seven planets, as one who ruled over a former aeon (*kalpa*). He is also said to be the brother of Vāstu³⁸ and it is his figure which is carved on the threshold of the Garbhagṛha, in the Śukanāsā on the Śikhara, the superstructure, and elsewhere on the temple (Pt. VIII).

All the cyclical numbers in Hindu cosmology are essentially based on the period of the precession of the equinoxes. They are exact fractions of the

³⁵ The Sāman or chant of Cyavana causes generation; 'Tāṇḍya Mahābrāhmaṇa', XIII. 5. 12-13; it procures nourishment, etc.; as it was first "seen" by Cyavana it is called the Chant of Cyavana (J. B., III. 128).

³⁶ Śaryāta is the night. Mānava is a patronymic from Manu: Manu Vaivasvata is the son of Vivasvān. Vivasvān is Mārtāṇḍa, the Sun, the mortal form of Brahman.

³⁷ R. Shamasastri, 'Eclipse cult in the Vedas', pp. 31, 39; Mysore, 1940.

³⁸ 'Śāradātīlaka', III. Comm. on śl. 2. An aeon or *kalpa* is one day of Brahmā. It is the period of the creation, evolution and destruction of a universe. Then, in the night of Brahmā this universe is completely reabsorbed; a new universe arises at the dawn of another day of Brahmā. A night or day of Brahmā has 1000 Yugas of the gods (cf. note 25, Part I).

number 25920.³⁹ It is for this reason that the Vāstumāṇḍala of the temple, the square diagram of Existence, of time measurable in space, has two main alternative dispositions as far as it is the metaphysical and cosmological plan of the temple. It is laid out in 64 or else in 81 squares; either number is a sub-multiple of 25920 which is $64 \times 81 \times 5$. 5 is the number of a Saṁvatsara, a cycle of 5 lunar-solar years.

The form of the square is the stage on which is drawn, while it is being acted, the movement of sun and moon and that of their years in their unequal course, their meeting, reconciliation and the fresh beginning towards one more coincidence. Such inequality, such imperfection are the cause of existence; the seasons similarly are brought about by the axis of the earth being inclined to the plane of its orbit. The obliquity of the axis of the earth, the inequality of the motions of sun and moon, produce the cycles in which we live. Were it not so, were all coincidence, life would be reabsorbed into perfection, into the infinite which is beyond manifestation.

On this Vāstu dial of cosmic movement where obliquity and discrepancies appear straight and square, care must be taken not to interfere with the movements and the ways in which they are laid out, for on their courses depend the order in the universe and the destinies of human lives. The science of architecture is part of the science of the luminaries; the time for setting up a building, its place and the direction it has to face are ascertained on the magic diagram of the Vāstumāṇḍala.⁴⁰

The very imperfection which is the cause of the existence of the world serves as the basis of all astrological forecasts and astronomical calculations. There is always a remainder. For nothing could continue if nothing were to remain. The place occupied by anything in the present, is in the residue of the past. The name of Vāstu, derived from Vastu, 'a really existing thing', signifies residence as well as residue (Ś.B. I. 7. 3. 18-19).

The position and orientation of a temple and of any building are determined analogous to the method according to which the place of sun or moon or one of the planets is found in the circle of Nakṣatras. According to the 'Sūryaprajñapti' the longitude of the heavenly body expressed in minutes is to be divided by 800,⁴¹ the quotient shows the number of Nakṣatras through which the planet has already

³⁹ R. Guénon, 'L'Ésotérisme de Dante', 2nd ed., p. 81. 25920 is the number of solar years in the Pythagorean Great year. R. Guénon, 'Some remarks on the Doctrine of Cosmic Cycles', JISOA, Vol. V, p. 21 f. "The principal base of cyclical periods in the cosmical order is the astronomical period of the precession of the equinoxes, the duration of which is 25920."

The period of the precession of the equinoxes $\times 1000$ is the number of years which must be added to 71 times the number of years contained in the 4 yugas $\times 14$. ('Viṣṇupurāṇa', I, ch. III).

4,320,000,000 years is a day of Brahmā (see Part II, note 38). But a day of Brahmā is also 71 times a Mahāyuga multiplied by 14:

$4,320,000 \times 71 \times 14 = 4,294,080,000$, or less than the preceding by 25,920,000. (Wilson, 'Viṣṇupurāṇa', I, c. Vol. I, p. 51, note 2).

⁴⁰ See Part I, p. 15. The Vāstumāṇḍala is the metaphysical plan of the temple, primarily; its cosmological and magical implications are derived from it.

⁴¹ The Ecliptic is divided into 27 or 28 Nakṣatras of $13^{\circ}20'$ or $800'$ each.

THE HINDU TEMPLE

passed and the remainder the traversed part of the Nakṣatra in which it is at the time. In a similar way is ascertained the position of a building in the cosmos; that is the direction which it is to face: the measurement of the building is to be divided by 8. The remainder indicates the particular direction which will be its own out of the 8 directions. This particular direction is the Yoni, its birthplace in the cosmos, where it is marked by its Vāstupuruṣa. The Vāstupuruṣas, and the respective remainders are given by Utpala commenting on the 'Bṛhat Saṃhitā', Ch. LII., 73, according to the teaching of other Ācāryas, and not of Varāhamihira.⁴²

THE EIGHT VĀSTUPURUSAS

	NE	E	SE	S	SW	W	NW	N
The 8 Vāstupuruṣas ..	Rikta (Vāyasa)	Dhvaja	Dhvāṅkṣa (Dhūma)	Simha	Śvā (Kukura)	Vṛṣabha	Vānara (Kapi)	Bhadra (Gaja)
Remainder	0	1	2	3	4	5	6	7
Planets	Sun (Sūrya)	Moon (Soma)	Rāhu	Mars (Maṅgala)	Mercury (Budha)	Jupiter (Guru)	Venus (Śukra)	Saturn (Śani)
Nakṣatras (stars) assign- ed to the Vāstupuruṣas	Āśleṣā (9)	Kṛttikā (3)	Bharaṇī (2)	Maghā (10)	Dhaniṣ- thā (23)	Rohiṇī (4)	Phal- gunī (11-12)	Śravaṇā (22)

If the remainder is 1, then the Yoni is Dhvaja, and the building faces East, if the remainder is 2, the Yoni is the SE, and so forth. If there is no remainder the building would have to face North-East. This is to be avoided by all means; it would be of evil portent were the building to face any of the corners of the square⁴³; similarly also the remainder should not be 2, 4, or 6, it must be uneven, so that the entrance of the building faces the East, preferably, or also the West, and less readily the North and still permissibly, the South. The remainder is found in different texts by taking account of various measures of the building to be set up. The perimeter for instance is multiplied by 3 and divided by 8. The remainder is that of the Yoni; should there be no remainder, the perimeter and proportions of the intended structure have to be altered.⁴⁴ Death, destruction and varied ills

⁴² See also 'Vāsturājavallabha'. The spatial symbolism of the Vāstupuruṣas is based on the daily movement of the sun; it is substituted by 12 Vāstupuruṣas, elsewhere.

⁴³ The corners must be strong; no door should be there for it would admit evil influences of the spirits and ghosts which are outside the precincts of the maṇḍala or vastu. The corners are exposed and vulnerable; they must be consolidated so that the bad influences stationed outside, cannot attack the building there and enter it.

⁴⁴ Utpala's commentary, 'Bṛhat Saṃhitā', ch. LII, 73 multiplies the interior length and breadth of the building and divides it by 8. The remainder is the Yoni. Similarly, 'Vāsturājavallabha', ch. III. 8. In other texts, the height of the temple is taken into account ('Vaikhānasāgama', ch. VI) while the 'Tantra-Samuccaya', Part I, ch. II. 3, considers the perimeter, and the 'Mānasāra', ch. IX. 68-74, the breadth of the building. Perimeter or breadth are multiplied by 3; this indicates an area equalling that of a circle with the breadth or the perimeter of the building as its diameter. 3 (instead of $\sqrt{10}$) is employed in the 'Mahābhārata', Bhūmiparva and Bhīṣmaparva, where the circumferences of the planets are stated in numbers which are the 3 fold of the numbers expressing the diameters.

result from a wrong orientation. If the building were to obstruct the course and order of the cosmos it would provoke disorder in the kingdom, and in the body of the builder. Yoni is an architectural formula; the remainder, gained through it, assures the fitness of the structure in the order of things and the well-being of the builder and his surroundings.⁴⁵ The remainder, particularly, is however, the Vāstu itself.

The drawing of the square plan, of the Vāstupuruṣamaṇḍala, is imperative prior to building a temple. The knowledge of its meaning and execution is the first discipline which the architect must master: there is no text on Indian architecture which does not deal with it or takes its knowledge for granted. At the height of temple building activity, when some of the noblest and largest Prāsādas were set up about the year 1000 A.D., the actual drawing of the diagram on the ground which the temple (prāsāda) was to occupy seems to have been the rule. From the stretching of the cord, or the drawing of the lines of the maṇḍala, every one of the movements is a rite and sustains, in its own sphere of effectiveness, the sacred building, to the same extent as the actual foundation supports its weight. These movements, rites and meanings are not accessory nor are they a mere accompaniment to the building itself. They go into the making of the Hindu temple, its shape and proportion and that of every carved detail and every figure, each at its proper place, with the rhythms and gestures, appropriate to it.

⁴⁵ The Yoni formula is but one of six formulæ, the Āyādi-Ṣaḍvarga, in which the remainder determines the gain or loss which will accrue to the builder, the Nakṣatra (ṛkṣa), the lunar day (tithi) and the solar day (vāra) on which it is good to build that particular building. These formulæ belong to astrology in general; they are applied to the building as though it is a living entity whose destiny is to be determined. It is however only their cumulative bad effect which makes any perimeter inauspicious once the Yoni formula is satisfied. (V. K. R. Menon, '6 Canons of Indian Architecture', 'Bulletin of the Sri Rama Varma Research Institute', 1934, pp. 67-77). The formulæ are not 'canons'. See 'Mānasāra', XXX. 168-194, etc. and P. K. Acharya, 'A Dictionary of Hindu Architecture', pp. 600-611.

The Yoni and the other five formulæ are considered when no other, definite injunction is given where the temple of a specified divinity has to face, etc. (see Part VII). The power of the specific divinity and its appropriate orientation outweigh the Āyādiṣaḍvarga.

SYMBOLISM OF THE SQUARE

THE ENCLOSURE

The angles of the square diagram lie in the intermediate directions. They are the turning points and require to be marked. There the pegs are driven into the ground and the cord is stretched between them to fence off the square. A line following the cord should be drawn with a golden or silver style or with curd or with pounded, unhusked rice (I.P. III. ch. XXVI, 89). Thus is the site taken possession of, on all sides. It is closed and is given its measure. "Let him fence all quarters so that no obstructions proceed from them" says the 'Mahānirvāṇa Tantra,' (V. 92), about the Digbandhana, the ritual gesture, the enclosing of a certain space by movements of hands and fingers which is analogous to the initial architectural procedure. That a certain site is delimited; that this site is bordered by the orients of this visible universe; and that its measure is derived from, and demarcates, the movement of the universe, all this is drawn on the ground with the golden style which follows the cord stretched between the four pegs at the corners. This is the preparation of the 'temple'.⁴⁶ It is in continuity of the rites around the Fire altar. "He draws lines around it. He thereby puts a measure to it" (Ś.B. VI. 3. 3. 23—24).

THE ORNAMENT OF VIŚVAKARMAN

Of all architectural forms in India the square is the leading symbol. The 'Brhat Saṃhitā' recounts how Viśvakarman, the archetypal architect⁴⁷ gave the first ornament to the banner of Indra. The banner of Indra, the King of the gods, was produced from Viṣṇu-Nārāyaṇa's lustre. It was carried on the eight wheeled fulgent chariot of the Sun.⁴⁸ The flag of the chariot of the Sun is Dharma, the Order of things in the universe. The gods presented this banner with various ornaments. The ornament given by Viśvakarman was of square shape, and its circumference was a third of the extension of the banner. Brahmā and Śiva made the second gift, a vary-coloured girdle, the cycle of the years and of time. It was

⁴⁶ 'Templum' with the Romans, from where the name temple is derived, was the square plot whence auguries were watched and interpreted by the 'contemplating' priests.

⁴⁷ Viśvakarman is Prajāpati (Ś.B.) as the universal constructive principle. He is called Viśvakarman because he created the activity of everything ('Brhad Devatā', II. 50). His name and function lend themselves to many and more or less specialised applications; see R. Guénon: 'L'Homme et son Devenir selon le Vedānta', p. 58, note.

⁴⁸ The eight wheeled chariot is the day, divided into eight 'yānias' of three hours. 'Br. Saṃh.', XLII. 6. Commentary. In the 'Viṣṇupurāṇa', II. VIII. 4, the body of the chariot is the year, and Dharma its flag, also in the 'Matsya, Vāyu' and 'Bhaviṣya Purāṇas'.

by one eighth part smaller than the square and each successive gift from the other gods was yet smaller by one eighth part. By raising that standard, the King of the gods annihilated in battle the host of the enemy, the children of darkness. The 'Br̥hat Samhitā' (XLII. 68) then says: "A prince who respects this institution, first established by Vasu,⁴⁹ the sky-traveller, and always since observed by other rulers, may feel certain that no danger from enemies shall befall him"⁵⁰ for this banner is that of royal Righteousness (rājadharmā).

The square symbol of the extended world in its order has precedence over the circle of time, the second ornament. Of the two, the first ornament, the square, is the larger, the comprehensive form, for it contains the cycles of measurable time.

There were no children of darkness prior to the raising of the standard when manifestation was not yet and the eight-wheeled effulgent chariot had not radiated the lustre which it was to carry through all time. When it began its journey, the children of darkness arose so that against them its lustre became apparent. They are its natural setting, complement and antagonists. Now the banner is radiant but is as yet without the ornaments of form and these the gods forthwith present. The square, first of all ornaments, is the perfect form, the perfection of order. Its identity is established by the pairs of opposites by which it is encompassed. By raising such a banner the host of the enemy is vanquished in disorder. It is as potent a weapon as Indra's Vajra, the thunderbolt, which also is square (RV. IV. 22. 2).⁵¹ Elsewhere ('Agnipurāṇa', ch. CCCV. 14), while enumerating the abodes of the different divinities, it is said that in the quadrangle (catvara) Śiva is present.⁵²

Time in its course, beginning, enduring, passing in cyclical continuity, is the vary-coloured zone of creation—duration—destruction affixed to the banner of Indra. The circle of time, in the hierarchy of form comes after the square and is enclosed in it in the Vāstumaṇḍala. Both these symbols are ornaments of Dharma, the Order of things in the cosmos and the world of man. This is exemplified with regard to Sacerdotium and Regnum, spiritual and temporal power. The golden handle of the fly-whisk and sunshade is square for priests, Brāhmaṇas, and circular for kings ('Agnipurāṇa', ch. CCXLV. 2).⁵³

The method of producing the square, adopted in Vāstu-śāstra is that of Baudhāyana (p. 22). According to this method, the construction of the square

⁴⁹ Vasu, the 8 Vasus, and Vāstu are all derived from the same root. See Part III, notes 59, 65 and 72.

⁵⁰ In the residence of a king, the Indradhvaja is hoisted in the central square, the place of Brahmā, which must not be encroached upon by any building ('Samarāṅgaṇasūtradhāra', XV. 47-48).

⁵¹ With this four cornered Vajra Indra slays Vṛtra.

⁵² Catvara is the levelled (square) ground prepared for a sacrifice. This does not imply that the ground-plans of Śiva temples are square in every instance. Śiva temples are square and also circular.

⁵³ In domestic architecture too, the buildings for Brāhmaṇas are square or nearly square, if rectangular, the length exceeds the width by 1/10 only. In the buildings of Kṣatriyas the excess is 1/6th; in those of Vaiśyas and Śūdras, 1/6th and 1/4th respectively (S.S. XIX. 18-19; Br. S. LII. 13). The lower the caste the further remote from the perfection of the square are the buildings which are suitable for its members.

presupposes circles. The circle is a dynamic form. It is full of tension and perpetual movement for it is set into motion and acquires form from the point in the centre. In its form is its origin, the point. Ontologically it is dependent on the mover.

Brahmā, the Creator, and Siva, the Destroyer, give the girdle of time as their joint present to the banner of Indra, which is Dharma. The circular shape of the girdle is also that of the Cakra, the wheel, a treasure of a Cakravartin⁵⁴ or world-ruler, and as Dharmacakra or principal wheel, a symbol of the Buddha.⁵⁵ The wheel, cosmic order in its function, the Dharmacakra, keeps on rolling. Cosmic order is ruled over by its king, the Dharmarāja. His residence, which is its place of abode and fulfilment is described as four angled or square and with four gates ('Garudapurāṇa', XIV. 5). Dharmarāja, is Yama, Death, who rules over the earth and has given to men a residence on earth.

The square is the archetype and pattern of order.⁵⁶ In Indian tradition accordingly, the world follows it in its geological and social structure. Mount Meru rises from a square base. Each of the four castes is assigned to one of the four sides of Mount Meru.⁵⁷ For this reason too, the four castes are made to live in towns or villages in the north, east, south and west respectively. ('Brhat-Samhitā', LII, 67-68).⁵⁸

Related in its proportion to the square is also the perfect measure of man for it is 'as high as broad'. This is the canon of his accomplished figure. From the root of the hair on the forehead to the soles of his feet, his length is equal to the width of his arms stretched out horizontally, from the tip of the middle finger of the right to the tip of the middle finger of the left. This is the standard of his proportion.⁵⁹ In this, the figure of man in its perfection is identical to that of the

⁵⁴ 'Mahāsudassana Suttānta' (S.B.E. XI ; S.B.B. III) ; 'Lakkhaṇa Suttānta' (S.B.B. IV).

⁵⁵ Barhut ; Coomaraswamy, 'Elements of Buddhist Iconography', Pl. V. It is carved on the pedestal of images of the Buddha preaching his first sermon (Sarnāth image, Coomaraswamy, HIIA, Pl. XLII) ; preaching to Bodhisattvas, 'Elements of Buddhist Iconography', op. cit. Pl. VII.

⁵⁶ R. Guénon, 'Le Roi du Monde', "In the figure of the celestial Jerusalem the circle is replaced by a square. The sphere represents the development of possibilities by expansion of the primordial and central point. It transforms into a cube, when this development is achieved and the final equilibrium is attained in that cycle".

The vision of Ezekiel (41, 1) describes the Tabernacle as 6 cubits square. The brazen altar in the Tabernacle in the wilderness (Exod. 27. 1) and the oracle in the temple of Solomon (I. Kings, 6. 20) are square in plan. The oracle in the Temple, and the heavenly city of the Apocalypse are cubes.

⁵⁷ Al-Biruni, 'India', ch. XXIII, p. 243, quoting Brahmagupta. Each side also has its appropriate colour. The East [Brāhmaṇas] white ; the North [Kṣatriyas] red ; the South [Vaiśyas] yellow ; the West [Śūdras] black. Meru, the cosmic mountain, is a symbol of the axis around which the revolutions of our world are effected. R. Guénon, 'Some Remarks on the Doctrine of Cosmic Cycles', JISOA, Vol. V, p. 21.

⁵⁸ The positions of the Brāhmaṇas and Kṣatriyas are reversed and similarly also the application of the 64 and 81 plan, in some of the texts. Varāhamihira, in ch. LII. 42-55, gives ascendancy to the 81 squares plan ; and also to the Kṣatriyas in their allocation in the East.

⁵⁹ 'Brhat-Samhitā', LXVIII. states that the 5 types of man, Haṃsa, Śaśa, Rucaka, Bhadra and Mālavya conform to this ideal proportion irrespective of the standard height laid down for each type.

Mahāpuruṣa, Supernal man, the Universal Being.⁶⁰ This measure of a fathom is also that of the square space in whose centre the Āhavanīya fire burnt and where the circular Gārhapatya equal in area to a fathom square had been piled up afterwards. "A fathom (vyāma) that namely is the size of a man and the altar should be of man's size" (Ś.B. I. 2. 5. 14).⁶¹ This square altar of a fathom length is the middle term between man (puruṣa) who is the sacrificer and the Puruṣa. In the Brāhmaṇas, Prajāpati, the lord of all creatures, takes the place of the Puruṣa. "That same Puruṣa became Prajāpati and that Puruṣa who became Prajāpati is this very Agni (Fire altar; Ś.B. VI. 1. 1. 5).

Based on the square, the structure of the temple arises in the mid-world (antarikṣa) of air. It is built in three dimensions, of different substances, brick, or wood or stone. They are cut or moulded to this purpose. If injury be incurred thereby he makes it good, but the living connection is severed and a transubstantiation is effected by which earth, tree and stone are made to enter the Kingdom of the Dharmarāja.

The Hindu temple is in no way derived from sepulchral architecture. As the Śmaśānaciti is an altar specially used for funerary rites, so are the Chatris for instance, cenotaphs set up by Rājput rulers to commemorate their predecessors, related to types of temples which are represented in relief in Barhut, about 100 B.C. The Chatris, from the 17th century to this day are open, pillared buildings.

Measure implies limits and limits mean end and death. It is by man's own, mortal frame that this knowledge of the structure of the universe is confirmed. The square, form of finality, is at the same time that of the pairs of opposites; manifestation is only through the pairs of contraries⁶² and in their balance lies the perfection of the square. Its proportion embodies, and thus resolves, the finality of limitation into a symbol of perfection. Proportion and balance are the form of the subtle (sūkṣma) nature of the square; their residue is the order which belongs to the city of the Dharmarāja, who is Death and a son of the Sun.⁶³ The other son is Manu, the prototype of man who gives its law to each cycle of existence.

⁶⁰ The Buddha as an embodiment of the Mahāpuruṣa has this perfect proportion; Kramrisch, 'Emblems of the Universal Being', JISOA, vol. III, pp. 148 f.

⁶¹ cf. Āp. Ś.S. XVI. 17. 10; and 15 where it is laid down that also "the Agni piled up for the first time should measure one square puruṣa".

⁶² The square throne of divinity rests on the following pairs of contraries: Order and its negation (dharma and adharma); Knowledge and ignorance (jñāna and ajñāna); Dispassion and its opposite (vairāgya and avairāgya), and sovereignty and its negation (aiśvarya and anaiśvarya). The positive values support the throne, as its legs, in the corners, in the intermediate directions. Their negations are situated at the shafts, in the cardinal directions. 'Īśānaśivagurudeva-paddhati', Part III. ch. XII. 25 (trans. JISOA. Vol. X. p. 227).

⁶³ Similarly, the finality of architectural form houses the life of man and is a seat of the living God.

THE REMAINDER

THE FORM OF MĀRTĀṆḌA

At sunrise another day begins, and time is added to time.⁶⁴ There was a yesterday where no sun shone and time did not exist, there was neither beginning nor end to anything so there was no thing, no limit. The non-limited, beyond limits, beyond the conditions which bring about the limits is Brahman. Being beyond all conditions, Brahman is all and everywhere and necessarily also in those conditions. So they too are within Brahman. Thus it is said "there are two forms of Brahman, time and non-time ('Maitrāyaṇī Upaniṣad', VI. 15). The one is deathless, the other is mortal; the mortal form of Brahman is the Sun. This Sun, whose children are men, is called Mārtāṇḍa.⁶⁵

Mārtāṇḍa is the eighth son of Aditi, him the Boundless (=Aditi) brought forth inarticulate, a lump of bodily matter, as broad as it was high. Some however say that he was the size of a man (Ś.B. III. 1. 3. 3).

The shape of Mārtāṇḍa is the result of Aditi's hybris. The 'Maitrāyaṇīya Saṃhitā' (I. 6. 12) tells the story. Aditi, wishing to get children, cooked rice. She offered it to the gods and ate the remnant. The result was that two sons were born of her. Again, she cooked rice, offered it to the gods and ate the remnant. Two more sons were born of her. She repeated the performance and again the result was the same. In consequence she concluded that she bore each time two sons because she had eaten the remnant of her offering. So she was tempted to eat first and then to offer the remnant. The result was that the two eggs within her were blighted. One recovered; the other appeared as dead and when born was Mārtāṇḍa.⁶⁶

Leaving aside the many implications of this story, the Sun Mārtāṇḍa, the son of Aditi, born of the unconsecrated remainder, is the father of Man and of Death (Manu and Yama). Each of the other seven sons too, is born of the 'remainder'. From the Remainder, Aditi, the Boundless, brings forth the Sun in its various forms, the measure of time, the condition of mortal life.

⁶⁴ Time in its cyclical appearance is manifested by the sun, moon and planets. It is the contingent aspect of duration. Duration is beyond division, it has no parts. Yet it is different from the unconditioned, unqualified Brahman (nirguṇa) of which it is the first qualified aspect. The unconditioned, unqualified Brahman is beyond duration and time. Duration is the principle of time and of death. The Sun (Mārtāṇḍa) is the Father of Death, and of Prototypal man, Manu, the Law-giver of each cycle (Manvantara; 4,320,000 years. [This is $10 \times 432,000$, the number of syllables of the Rg Veda]). Duration as the principle of cyclical time is Śiva-Bhairava or Kāla Mahākāla (see ch. on Rāhu; Pt. VIII).

⁶⁵ RV. X. 72. 8; 'Maitrāyaṇīya-Saṃhitā', I. 6. 12. The egg which appeared as dead, "Mārtāṇḍa"

⁶⁶ The eight sons of Aditi (RV. X. 72. 8) are the eight Ādityas, the seven and one suns; Mitra and Varuṇa, Dhātā and Aryaman, Amṣa and Bhaga, Indra and Mārtāṇḍa are their

VĀSTU, THE REMAINDER

The shape of Mārtāṇḍa which is that of the Sun as father of Man and of Death,—the shape of the remainder, born from the boundless, is “as broad as it is long”. Of this shape the diagram is a square. Its eight main points situated at the corners and the middle of each side, at the cardinal and intermediate directions, are occupied and identical to the 8 Vāstupuruṣas, who themselves are but ‘remainder’ in each particular instance (p. 38). Altogether, as its name implies, Vāstu is the remainder.

The remainder or residue is that which remains or subsists when everything else has come to a conclusion. If something is complete in itself, perfection, nothing is left over, there is an end of it. If there is a remainder there is no end to it. So the remainder is the germ and material cause for what subsists. It is the concrete reality of a thing.

The residue of the sacrifice is called Vāstu (Ś.B. I. 7. 3. 18-19).⁶⁷ What has been left over, should not be added later on. For it is left over for Rudra (‘Maitrāyaṇīya Saṃhitā’, I. 5. 13). A hymn of the Atharva Veda is sung in praise of the Residue of the offering: “Name and Form are in the Residue. The world is in the Residue. Indra and Agni are in the Residue. The Universe is in the Residue. Heaven and Earth, all Existence is in the Residue.” (AV. XI. 9. 1-2 a). This residue where all existence is set together, is Vāstu. Rudra is called Vāstavya, for a remainder (vāstu) is that part of the sacrifice (Ś.B. I. 7. 3. 7). And the ‘Taittirīya-Saṃhitā’, III. 4. 10. 4, says: Vāstoṣpati (the lord of the Vāstu or remainder) is Rudra.

Rudra is Vāstoṣpati. Vāstoṣpati is but another name for Vāstupuruṣa, the Puruṣa who is Vāstu. The Vāstu, in which reside (vas) the gods, is the residue, and the place of the germ of things to be and of the order of the extended, the plan, in principle, of the temple. Before dealing with the Vāstu as Puruṣa (Supernal Man) the Vāstu as maṇḍala (diagram) has to be explained in its parts and range, so that the whole Vāstupuruṣamaṇḍala becomes clear in meaning and application.⁶⁸

names in the ‘Maitrāyaṇīya Saṃhitā’, I. Here the remnant is of food. By eating some kind of food children are born to the immortals, or by inhaling some scent, or by mere touch.

Cosmogonically, the Sun is produced from the Boundless and the Remainder. Ontologically, the Remainder, Vāstu, Existence in its cosmic order, is the diagram where the Sun and the other Luminaries are shown in their respective places.

⁶⁷ The passage can equally be rendered “The site of the sacrifice is Vāstu”; for when the sacrifice is completed, and all is burnt up or consumed, what remains of it is but the site where the offering took place. This site is the Vāstupuruṣa just as the sacrificial altar is the Puruṣa.

⁶⁸ The Vāstupuruṣamaṇḍala is discussed here, as everything else concerning the Hindu temple in three of its aspects; metaphysically (parā), in its subtle aspect (sūkṣma), and descriptively (sthūla), in its physical aspect, its delineation.

THE TWO MAIN TYPES OF THE VĀSTU DIAGRAM :

A. THE MAṆḌALA OF 64 SQUARES

The 'Bṛhat Saṃhitā' speaks of two types of diagrams, one consisting of 64 equal squares (pada) and the other of 81 squares. In chapter LV. 10, it is enjoined that the area of the temple should always be divided into 64 squares.⁶⁹ Similarly, the 'Hayaśirṣapañcarātra' (VIII. 150) lays down that the diagram of 64 squares is for the construction of shrines, and a diagram of 81 squares for the construction of houses. The 'Īśānaśivagurudevapaddhati' (Pt. I. XI. 7 and Pt. III. XXVII. 2) makes it clear that a Vāstu of 64 squares is for worship by Brāhmaṇas, and one of 81 squares for worship by kings.⁷⁰ These views are not quite the same; but it is obvious that the Vāstu of 64 squares is meant for the construction of shrines and for worship by Brāhmaṇas and the Vāstu of 81 squares is for the construction of other buildings and for worship on behalf of kings (Kṣatriyas); or that the diagram of 64 squares and also of 81 squares are fit for temples, but the first is for worship by Brāhmaṇas, the sacerdotal power, and the second for worship on behalf of the temporal power (Kṣatra).⁷¹

The special sacredness of the maṇḍala of 64 squares is stressed in other texts : the 'Vāstuvīdhāna' (IX. 2.) enjoins that the pedestal (pīṭha) or hearth (dhiṣṇya) for the worship of Vāstu (vāstupūjā) should have 64 squares, while in ch. X. 1-6 (ibid.) it is stated that the Vāstumaṇḍala in which is situated the body of the Vāstupuruṣa should consist of 81 squares. This is corroborated, for instance, in the 'Prayogapārijāta' (chapter : Vāstu-homa, 1-3; p. 94). There the Vāstu of 64 squares is prescribed for the rites of initiation (dikṣā), the installation of images, (pratiṣṭhā) and for sacrificial offerings (yāga) whereas it is said that the maṇḍala of Vāstu has 81 squares.

There is a difference in meaning and purpose, on one basis in common between the two main types of the Vāstupuruṣa-maṇḍala. The prototype is the one of 64 squares. The maṇḍala of 81 squares is drawn in closer conformity with

⁶⁹ The 'Bṛhat-Saṃhitā', LII. 73, commentary, points out an exception to the rules of ancient Ācāryas : Viśvakarman has not explicitly spoken of the maṇḍala of 64 squares (he includes it in that of 81 squares ; in the opinion of Utpala).

⁷⁰ Also 'Matsya Purāṇa', ch. CCLIII, 47 : "Brahmā has enjoined the maṇḍala of 64 squares for Prāsādas" ; 'Bhaviṣya Purāṇa', ch. CXXX. 17 : "The place of the temple should be divided into 64 squares". 'Agnipurāṇa', ch. XCIII. 1 : "After having laid down the cords for the Prāsāda make the Vāstumaṇḍala (the text has 'Vāstumaṇḍapa') of 64 squares. In house and city (nagara) one should worship in 81 squares". 'Śāradātīlaka', III. 7, comm. : (a) 64 squares for the Prāsāda ; (b) 81 for a house, quoting (a) Somaśambhu, (b) 'Mahākapila-pañcarātra' ; nevertheless the 'Matsya Purāṇa' describes in the first place the Vāstupuruṣa-maṇḍala of 81 squares (ch. CCLIII. 19 ; ch. CCLXVIII) ; also the 'Bṛhat Saṃhitā', LII. 42-55.

⁷¹ Four factors : (1) temple, (2) non-temple, and (3) Brāhmaṇas and (4) Kings-Kṣatriyas are referred to in this passage, crosswise ; its meaning is unmistakable.

the 'body' of the Vāstupuruṣa, and appears to have been used by Kṣatriyas in contradistinction to the cosmic plan of 64 squares. At the time of the construction of the temples which yet stand and of the treatises about them, this distinction, though still known, was not necessarily also made. Varāhamihira, in the sixth century, speaks of either type, specifies the use of the maṇḍala of 64 squares and gives major importance by describing it in detail, to the maṇḍala of 81 squares. At the climax of the temple building activity (about 900-1100 A.D.), the 'Īśānaśivagurudeva-paddhati', after having clearly distinguished between the two plans decides: If of 81 squares, it is fit for Prāsādas, and kings too (III. ch. XXVII. 3), and concludes by prescribing that 81 squares are drawn on the square floor of the Prāsāda to be built (ib. 58-60). The 'Kāmikāgama' (XVII. 107), after discerning the types sums up its position. "In this text-book (śāstra) it is said that everything is fit for all". While this was held at the time when the temples were actually built, the implied difference of meaning on its common basis requires to be investigated in the two main types of maṇḍalas which are relevant to the temple.

Altogether 32 types of maṇḍalas are given according to which all works of architecture are planned or regulated. These maṇḍalas form an arithmetic progressive series from 1 to 32; the respective numbers indicate the units into which the side of the square maṇḍala is divided in each case. The series of maṇḍalas corresponds to the geometrical method of gnomonic extension. In the Sārārathacakracit (p. 27), a square of 4 bricks is made in the centre of the sacrificial site (agnikṣetra). By gnomonic extension, the square is increased to one of nine bricks by adding five; this is increased to one of 16, etc. The bricks themselves are square, each measuring one foot (pada) generally (Ś.B. VIII. 7. 2. 17). So there are 8 bricks or squares facing each direction, in a square of 64 equal parts.

The numbers 8 and 16 which form part of and produce the square of 64 Padas, refer to the Sun and Moon. During the 8 Praharas of the day, from sunrise to sunrise the sun enters one by one the 8 quarters ('Viśvakarmavidyāprakāśa', 126).⁷² Thus it can be said there are 8 suns. The 16 digits (kalā) of the moon represent the sum total of its phases. 16, the square of 4, is the perfect number and is embedded in the maṇḍala of 64 squares. But the square of 8 units has the wider significance.

Ayodhyā, the impregnable city of the gods, has eight Cakras (cycles; AV. X. 2. 31. 'Taittirīya Āraṇyaka', I. 27. 2-3). "The city of Ayodhyā" is of two

⁷² See Part II, note 48, quoting 'Bṛhat Saṃhitā' (the 8 yāmas of the day).

⁷³ The Cakras of the microcosm are: Mūlādhāra, the support of all the Cakras; Maṇi-pūra, the seat of mind (manas); Svādhiṣṭhāna, the seat of intellect (buddhi); Anāhata, the seat of the principle of articulate sound (Śabda brahman); Viśuddhi, the seat of Ether (ākāśa) which is the substratum of the quality (guṇa) sound; Ājñā, the seat of knowledge (bodhana); and Sahasrāra or Śiva-Śakti or Bindu, the point limit between the unmanifest and the manifest. 'Vācaspatya', s.v.

The eight Cakras are also given as the eight means necessary to control the inclinations of the inner faculties. They are: Yama, restriction, Niyama, observances, Āsana, sitting posture, Prāṇāyāma, breath control, Pratyāhāra, emptying the mind from external objects, Dhāraṇa, its subsequent concentration, Dhyāna, keeping it concentrated and Samādhi, merging and dissolving it in the object of its concentration ('Tantrarāja-Tantra', XXVII. 54-55).

kinds; with reference to man, the microcosm, and with reference to the universe, the macrocosm. In man, the Cakras lead from the Mūlādhāra, the seat of consciousness (cit), to the Bindu-Trikona or Śiva-Śakti, the Supreme Principle in the Sahasrāra.⁷³ In the universe the eight cycles are those of the eight suns, presided over by the eight Ādityas.⁷⁴ Within Ayodhyā, is the golden compartment, ever illuminated by light. The centre is Brahmapura, the stronghold (pur) of Brahman (AV. X. 2. 32). It corresponds to the Brahmasthāna, in the centre of the Vāstupuruṣamaṇḍala (p. 32). In the 'Rāmāyaṇa', the city of Ayodhyā is beheld as a square of 8 compartments on each side (aṣṭāpada).⁷⁵

The 8 Ādityas preside over the suns, the celestial luminaries. It is from there that this universe is brought into appearance or existence, ordered in its total extent and consistent in its order. Its consistency expresses itself in the numbers and their relation which is the rhythm of the universe and its structure. This is laid out in the plan of sixty-four squares.

Among metres,⁷⁶ the Anuṣṭubh with its 4×8 syllables is the symbol of the celestial sphere. The 'Aitareya Brāhmaṇa' (I. 1. 5. 8) pictures the hierarchy of the universe evoked by the metre Anuṣṭubh,—64 syllables being in two Anuṣṭubhs: Each of the three worlds (earth, air, sky) contains 21 or 3×7 places, one rising above the other. "By 21 steps he (the sacrificer) ascends to each of these severally, by taking the 64th step he stands firm in the celestial world". Numerically, it lies within the precincts of the square of 64 parts into which it appears precipitated.⁷⁷

The 'plan' of 64 squares is called Maṇḍūka or Bhekapada or Ajira.⁷⁸ The plan of 81 squares is known by the name of Paramaśāyika in all the texts. In it is expressed that the Vāstupuruṣa is laid to rest.⁷⁹

⁷⁴ R. Shamasastri, 'Eclipse Cult', etc., op. cit. pp. 82-93.

⁷⁵ 'Rāmāyaṇa', I. 5. 16. The universe, as a board of 8×8 squares (aṣṭāpada) fastened with golden cords, is described also in Buddhist texts (Saddharma Puṇḍarīka), Burnouf, 'Lotus de la bonne Loi', p. 148.

The game of chess 'aṣṭāpada', the board of 8×8 squares was known in Vedic India. The board was called Koṣṭhika or Koṣṭhāgāra; Kaye, 'Hindu Astronomy', ASI, Mem. 18, p. 151.

⁷⁶ The science of metres or rhythms (chandas) extends to the rhythmical disposition of the ground-plan of the temples (talacchanda; Part VII) and their vertical section (ūrdhvacchanda).

⁷⁷ The number 21, the comprehensive number of the manifested universe has no part in the symbolism of numbers of the Vāstupuruṣamaṇḍala.

64 is also the number of the arts practised by man. Śiva imparts the 64 divisions of Kalājñāna to Garga; here the Moon aspect prevails (see Part I, p. 15). There are also 64 Manu Smṛtis; 64 Āgamas.

⁷⁸ Maṇḍūka is the generally accepted name. The 'Mayamata' (VII. 57) says: The Sthāṇḍila (a piece of ground, levelled, squared and prepared for a sacrifice; sacrificial ground), called Maṇḍūka, has 64 squares (pada).

The 'Śaivabhūṣaṇam', p. 140 employs the term Bhekapada for the diagram of 64 squares. Bheka means 'frog'; so does Maṇḍūka. The association is that of sitting motionless like a frog, a posture adopted in Maṇḍūka-yoga.

The Primeval Frog, Mahā-maṇḍūka is the Great Energy which ultimately supports Śeṣa, the Remainder, the world serpent on whom rests the universe.

'Viṣṇudharmottara', II. ch. XXIX. 35; Ajira means enclosed space; another meaning of the word is frog; cf. 'Śaradātīlaka', III. 8. Comm.

⁷⁹ 'Īśānaśivagurudevapaddhati', JISOA, vol. IX. p. 192 (trans. and notes by St. Kramrisch).

B. THE MAṆḌALA OF 81 SQUARES AND THE VĀSTUPURUṢA

The square of 64 or 81 divisions is occupied by the Vāstupuruṣa. It is his very shape (svarūpa). The square of 81 compartments as explained in the 'Vāstuvīdhāna' (X. 1-6) is occupied by a picture of the Vāstupuruṣa. His subtle body with its parts, limbs and apertures is interpreted as co-terminous and thus one with the 81 squares of the plan. The coincidence (ib. VIII. 26, 31) of the diagram (yantra = maṇḍala) and of the 'body' (śarīra) of the Vāstupuruṣa as one form (rūpa) is more suggestively laid out in the Paramaśāyika than in the Maṇḍuka plan.

The identification of the 'body' of the Vāstupuruṣa which has expansiveness but no tangible volume—with the plan of the Vāstumaṇḍala is an accomplished fact, in the Purāṇas and in Vāstusāstra. The maṇḍala or yantra on the one hand, the subtle body of man on the other, have each their own place in the Indian methods of concentration and realisation. The maṇḍala, in addition, is replete with magical efficacy, while the subtle body of man is the place of realisation by the practice of the discipline of Yoga. The Vāstumaṇḍala as tabular presentation of the hierarchy of ordered existence is complete without the image of the Vāstupuruṣa. The Paramaśāyika plan, however, neatly identifies the Vāstumaṇḍala and the Vāstupuruṣa.⁸⁰

The tabular representation (prastara-mārga) in 81 squares accommodates the 32 divinities of the border (p. 32) in entire compartments and avoids the halves of squares in which some of these, and also of the other gods, have to be confined in order to find room in the Maṇḍuka maṇḍala. The fractionless allocation of the Vedic gods on the 'body' of the Vāstupuruṣa is effected in the square of 81 compartments. The 'descent' of the Vāstupuruṣa to earth, and the settlement of the gods on this Puruṣa, one with him on earth, is represented in the square of 81 parts.⁸¹

While the square of 8 represents the order of the celestial world, established and illustrated on earth, by the drawing of the yantra of 64 squares, the square of 9 leads from the subtle body of the microcosm⁸² and its image to the universe, which it encloses. Eight are the Cakras and nine the doors (navadvāra) of Ayodhyā, the microcosm. They are the mind (manas), intellect (buddhi) and the 7 apertures of the body. Nine is the number of Agni, of Fire in its display, and in its essence,⁸³ for eight are the forms of Agni and the ninth is the Fiery essence which has

⁸⁰ Some of the series of 32 maṇḍalas are altogether without the Vāstupuruṣa. Moreover, assigned to their concentric borders are not the 45 Vedic gods, but in the zones surrounding Brahmā, the gods, men and the demons respectively are allocated.

⁸¹ His legend and its meaning are given in part III.

⁸² The term microcosm is used here with reference to the 'body', not of man from whom the image is taken, but of the Vāstupuruṣa.

⁸³ Ś.B. VI. 1. 3. 18: Eight forms of Agni; Kumāra (the boy) is the ninth. That is Agni's three-fold state.

The 8 forms of Agni are Śarva, Īśāna, Parjanya, Rudra, Paśupati, Ugra, Aśani, Mahādeva; the 'Fire' in water, Sun, rain, etc.

Ś.B. VI. 2. 1. 1. "Prajāpati searched for that boy who had entered into the different manifestations."

entered, and is its forms. That is Agni's threefold state on earth, in the air and in heaven (Agni, Vāyu, Āditya; Ś.B. VI. 7. 4. 4) throughout all the degrees of manifestation. While this refers to the universe, the macrocosm, it has at the same time its correspondence in man, the microcosm, in whose body the nine immanent breaths (prāṇa) are the "immortal parts" (AV. V. 28. 1; Ś.B. X. 1. 4. 1; Ait. B. I. 4. 20).

By drawing the maṇḍala of the Vāstupuruṣa, a rite which is to be repeated, reality is reconstructed whenever a temple is built, so that the Puruṣa may live "in the city in which he sleeps." This is implied in the name Puruṣa explained as Puri-śaya, "one who sleeps in a city" (Yaska, 'Nirukta', I. 13).⁸⁴ It is in this application that the Vāstupuruṣamaṇḍala of 81 squares, the Paramaśāyika plan, is prescribed for the houses of all castes, for the palaces of Rājas and for the Indrasthāna, the temple of Indra⁸⁵ ('Samarāṅgaṇasūtradhāra', XIII. 3).⁸⁶

The Paramaśāyika plan is all the time but another aspect of the city of Ayodhyā, which, while it has 8 Cakras, has 9 entrances (dvāra). Number being the primary substance of the universe, 64 and 81, the squares of the Maṇḍuka and Paramaśāyika plan, are the basis on which rests the temple in which the universe has its image, and man his place of transformation.

⁸⁴ AV. X. 2. 30.

⁸⁵ Indra, king of gods, is the divine archetype of the Regnum (kṣatra). A. K. Coomaraswamy, 'Spiritual Authority and Temporal Power in the Indian Theory of Government', JAOS. 1942.

⁸⁶ The 'Mānasollāsa' (II. III. 1. 73-74) which is a 'royal' compendium, only refers to the plan of 81 squares. The original distinction between the plans of 64 and 81 squares is however not maintained in Vāstu-śāstra where architecture other than sacred is dealt with. The 'Samarāṅgaṇasūtradhāra' for example, ch. XIII. 4-5 assigns to all kinds of Prāsādas and Maṇḍapas, the Vāstu of 100 squares and the Vāstu of 64 squares to camps (as residence) of kings, villages, hamlets and cities. The 'Samarāṅgaṇasūtradhāra' deals first with the square of 81 parts, then with that of 100 parts and finally with the squares of 64 parts. The 'Vāsturājavallabha', II. 4, for example, assigns the 64 squares Vāstu to villages, palaces of kings and towns; that of 49 squares to the reconstruction of dilapidated buildings; that of 100 squares to all wells, tanks and ponds, etc. A Vāstu of 1000 parts should be worshipped at the construction of forts and cities, in great 'pūjās' and sacrifices, etc. (II. 25).

THE ORGANISM OF THE PLAN

The size of the Vāstupuruṣamaṇḍala is of no matter. It is coterminous with the building site, or with the extent of the Prāsāda or of a minimum standard size. In it are laid out the positions of the several buildings to be set up on the site and also the positions of the buttresses of the temple (Part VII). The lines by which the square plan is divided into small squares, the two diagonals of the plan and the 'lesser diagonals', 4 or 8 in number, and drawn parallel to the former have a definite width, proportionate to the size of the plan. The width of the main diagonals in a plan of 81 squares measures as many finger breadths (aṅgula) as the side length of the small square measures in cubits (hasta; Br. S., LII. 62-63); and the straight lines have one and a half times this width. Their intersection (marma; a vital, or vulnerable spot) measures one eighth part of one square in the plan of 81 squares.⁸⁷ The division of the square and also the divisional lines themselves are measured in proportion to its total extent. No building, or part of the temple must be placed on these vital points.

The archetypal measure (māna) of the line (sūtra) is known as Prāṇa, immanent Breath or Energy (pneuma).⁸⁸ By it is measured the width of the outline of one square in an 'ardha-kṣetra' (half field) of 360 squares ('Kāmikāgama', XVIII. 8). This half field of 360 units is part of a wider extent. The whole field has 720 units ($8 \times 9 \times 10$); or, if 360 is multiplied by 72, or 9×8 , which are the side lengths of the two types of the Vāstupuruṣamaṇḍala, the number 25920 results which is the number of years in the period of the precession of the equinoxes. From Ayodhyā, the impregnable stronghold (pur) of the gods, with its 8 Cakras and 9 doors, the whole field of 720 days and nights of the year is extended which is one of the units of cyclical time in the Vāstumaṇḍala.

Prāṇa, the breath of life, immanent Breath, in man, the microcosm, is one in principle with Brahman (Śaṅkarācārya, comm. 'Brahma Sūtra', III. 2. 7). In deep sleep (suṣupti) all the faculties of knowledge, sensation and action are withdrawn in Prāṇa. Prāṇa governs and is manifest in the vital functions of breathing, etc., which are called Vāyu, vital activity. In the 'Kāmikāgama' the lines (sūtra) are measured in terms of Prāṇa and Vāyu as archetypal measures. The Breath of life, immanent Breath, in the functions of breathing, etc., is the network that holds together the 'body' of the Vāstumaṇḍala. In its duration it lies extended.

The immanent breaths (prāṇa) are the immortal parts of the body (Ś.B. X. 1. 4. 1). With them, drawn in a network of lines, the body of the Vāstupuruṣa lasts as long as the present aeon (kalpa). The lines are not mere geometrical

⁸⁷ The Marmas are of special importance in the site-plan. Where the Vāstumaṇḍala is co-extensive with the Prāsāda they affect the position of pillars in temples as described in the 'Samarāṅgaṇasūtradhara', ch. XLIX. In brick and stone temples such as are preserved the Marmas affect the positions of windows, buttresses, etc. of the wall of the Prāsāda.

⁸⁸ Prāṇa is also the smallest unit of concrete (mūrta) time; it is the time needed for inspiration and expiration.

connections; their prototype has the measure of Breath; they have direction and width; while they form a net cast over the plot, they also share in its extent, represent it in an aliquot ratio and their points of intersection are the vital parts and tender spots (marma) of the site. These must not be hurt or interfered with by setting up pillars, doors, or walls, on them.

The identification of this body built of Breath which is coterminous with the Vāstumāṇḍala, with that of the builder who is the Yajamāna and patron, and with the plot, is no abstract theory. It is felt in the living tissue of the body of the donor who is the builder (kāraṇa) of the temple ('Samarāṅgaṇasūtradhāra', LVI. 303). Were the organism of the ordered plot brought out of order and disturbed in its interknit functioning as plan and symbol, the builder would suffer in the corresponding parts of his body and earthly life; death will befall him should he obstruct by building on them, the main vital parts of the plan, its head, heart and so on; and minor evils will be his if he disregards the lesser junctions and lines. Builder and building are one; the building is a test of the health and probity of the builder, his 'alter ego', his second body; if the building be a sacred one, a temple, this second body is his sacrificial body born from a second birth, the conscious sowing of seed, into a prepared soil and the depositing of the Seed of the building to be which is the germ of the Puruṣa, the Essence that dwells in the body of the temple. This new birth and transubstantiation has for its level the surface within the limits of the māṇḍala.

The places which must not be encroached upon by doors, walls or pillars, beams, etc. and windows (gavākṣa, vātāyana; Br. S. Comm.; LII. 57, 'Samarāṅgaṇasūtradhāra', XIII. 10-16), at the concurrence of the lines (sūtra) are listed on p. 55.⁸⁹ They are avoided by shifting for example the position of the

⁸⁹ The 'Br̥hat Saṃhitā' enumerates 9 specially vulnerable spots (atimarṇa) and gives the proportionate size of the tender spots (marma). These are grouped according to their importance and specified in the later texts according to the lines which meet, diagonals and orthogonals, and their number, at each respective crossing. The size of a vulnerable spot is given in the 'Br̥hat Saṃhitā' as $\frac{1}{8}$ th of a square (the whole plot being divided into 81 squares). The 'Samarāṅgaṇasūtradhāra' however gives to the conjunction of 8 varṣas (=8 sūtras, at their meeting point) the extent of the tip of a hair (bālāgra); that is, the concurrence is just a point. The $\frac{1}{8}$ th of a small square of the 'Br̥hat Saṃhitā' does not correspond to the actual extent of 'marma'; it appears more as a parcelled plot with the concurrence of the lines in its centre and agreed upon to be $\frac{1}{8}$ th of that of the small square. In the 'Samarāṅgaṇasūtradhāra', the 'sandhi' or conjunction of lines has no magnitude. It is a point to be avoided when determining the position of the middle of door openings, pillars, etc. According to the 'Kāmikāgama', XVIII. 9, Prāṇa and Vāyu are the prototypes of measurement of the width of the Sūtras. The Mahāvārṣa has twice the width of the Anuvārṣa, etc. The archetypal measure, Prāṇa, is one breath—duration. The standards of extension are its modifications. In a field of 3 cubits, the line (sūtra) measures one barley corn (yava); with an increase of the field by one cubit, the lines should be thicker by one Roma (hair; ib. 18-19). The relative size of a Marma in this text too, has the eighth part of a 'pāda'.

The measures generally used in Vāstu-Śāstra are: 1 Bālāgra [or Roma], tip of hair = 8 Rathareṇu (trasareṇu), mote of dust in a sun beam [1 Trasareṇu = 8 Paramāṇu, visible only to Yogins]; 8 Bālāgras = 1 Likṣa, nit; 8 Likṣas = 1 Yuka (louse); 8 Yukas = 1 Yava (barley corn); 8 Yavas = 1 aṅgula; 12 aṅgulas = 1 vitasti (span); 2 vitastis = 1 hasta (cubit) = 1 kiṣku; further units of measurement, increased by one aṅgula each time: (Prājāpatya, Dhanurmuṣṭi, Dhanugraha, etc.) are used for measuring temples (vimāna), sites (vāstu) and villages, etc., but 'hasta' or 'kiṣku' is the most generally used unit of measurements in objects of larger

respective parts of the building, to the right of the vulnerable points.⁹⁰ Similarly also nothing (no 'dravya') may be placed on the border or middle lines and the consequences are serious too, though not fatal, if the other orthogonals and the 2 diagonals are infringed (ib. XII. 23-36).⁹¹ The earlier texts however limit the tender spots to the concurrences of lines: (Br. S. LII. 57; 'Viṣṇudharmottara', Pt. II, ch. XXIX. 45-46)⁹²: The spots which are the most vulnerable and which must be avoided with great care, are in and around the Brahmasthāna, the centre of the square.

The connections of the Vāstupuruṣamaṇḍala and the buildings to be set up on it are manifold. They comprise the position of temples sacred to distinct divinities,⁹³ of definite buildings in definite parts of the maṇḍala and the position of the images at their definite places. In addition to these iconographic considerations, the slight deviation of doors, pillars, etc. from a uniform and mechanical symmetry contributes, as in the forms of life, towards a fuller consonance, of the proportions of the architecture. The living breath of Vāstupuruṣa would thus be seen to permeate the total structure.

size, from bedsteads and conveyances upward ('Vāstuvidyā', I. 4-10); re. the various types of aṅgulas, see the 'Kāmikāgama', XVI. 2-9; I.P. III. ch. XXIV. 31.

Apart from the various kinds of aṅgula, the scale of measures is further differentiated. 8 yavas make the chief or 'best' (jyeṣṭha) aṅgula, while the middle variety of the aṅgula has 7 yavas and the least type of aṅgula has only 6 yavas. The hasta thus is also of 3 types. They are called: Prāśaya, Sādhāraṇa and Mātrāśaya respectively ('Samarāṅgaṇasūtradhāra', IX. 5, 10, 28-30). In this Śāstra, one aṅgula is called Mātrā, 2 aṅgulas are one Kalā, 3 are one Parvan, 4 a Muṣṭi, etc., Aratni is a synonym of hasta (ib. 40-44). Vyāma or Puruṣa has 84 aṅgulas or 3½ hastas (śl. 45).

⁹⁰ This is described in the 'Vāstuvidyā', VI. 3-7 where it is shown how to avoid a coincidence of the Madhyasūtra of each of the buildings in the 4 directions, with the Madhyasūtra of the total site, etc. The Madhyasūtras of the buildings are drawn at a distance of 11, 9, 7, and 5 aṅgulas respectively, beginning from the east to the south; in the south, to the west, etc.

⁹¹ It is generally enjoined that no doors, etc., must be placed on the orthogonals, diagonals, concurrences and the centre of the site.

⁹² The 'Agnipurāṇa', ch. XCIII. 7-9, makes it clear that the concurrences of all the orthogonals and the following 12 types of concurrences are to be avoided; Mahāmarmā, Anuja, Hala, Triśūla, Svastika, Vajra, Mahāsvastika, Samputa, Trikaṭa, Maṇibandha, Saviśuddha and Padamarmā (when making wells, etc.). Amongst the southern texts, the 'Kāmikāgama', XVIII. 19-20, enumerates 9 positions where no temples of gods should be set up: Hrdaya the heart, the centre; Vamśaka, the diagonal, Sūtrabandha, a concurrence of lines, Sirā, and 6, 8 or 4 Śūlas.

⁹³ With reference on the other hand to the Vāstumaṇḍala, as the plan of the entire site (of a village, or a town, or the king's palace, etc.), the position in it of a temple dedicated to a special divinity remains the same in Śaiva as well as in Vaiṣṇava tradition. Comparing the situation of the temples in a Śaiva text, the 'Īśānaśivagurudevapaddhaṭi', Part III. ch. XXV. 64-66, and a Vaiṣṇava text, the 'Vaikhānasāgama', Ch. II., it is seen that a temple of Śiva (Śaṅkara) is assigned to Īśāna, the north-east, a temple of Viṣṇu or Varuṇa to the west. Other forms of divinity are allocated to their, equally corresponding plots. Buddha temples for inst. are assigned to Sugrīva, south of Varuṇa, on the western side. The place of Brahmā is always in the centre, and various forms of Viṣṇu for instance, are found in various places; they may also occupy the centre ('Vaikhānasāgama', 1. c.) which is the place for temples of all the gods ('Tantrasamuccaya'. See Part VII).

The position of the forms of divinity, in a Vaiṣṇava temple is given most explicitly in the 'Kāmikāgama' and 'Vaikhānasāgama'.

See plan, Gopinatha Rao, 'Elements of Hindu Iconography', Pt. II. Vol. I, Appendix A.

THE HINDU TEMPLE

The terminology of the parts of the Vāstumāṇḍala, is given now according to Vāstu-śāstra.

A. The lines (sūtra) of the Vāstupuruṣamāṇḍala.

	I Br̥hat Samhitā, Ch. LII and Utpala's commen- tary.	II Iśānaśivaguru- devapaddhati, Ch. XXVII.	III Samarāṅgaṇa- sūtradhāra, Ch. XII.	IV Vāstu-Vidyā, Ch. VI.	V Śilparatna, Ch. XIII.
Sūtra (cord, line).*		the Sūtras are the Sirās of the Vāstupuruṣa. (62).	are Mahāvamśas (27).	sides (nāḍī) and diagonals (rajju) are Sūtras. (13).	
Prāk-sūtra.		is known as Ūrdhva-vamśa. (61).			
Udak-sūtra.		is known as Pārśva-vamśa. (62).			
Madhya-sūtra.				middle line, in the E-W direc- tion is called Brāhmyarekhā. diagonal, S.W- N.E., Marāṇa- sūtra; N.W.-S.E., Jivasūtra. (5-6)	
Karṇa-sūtra.					
Sirā* (any tubular vessel, nerve, vein).	The 10 lines which are drawn from E-W, and S-N in a site of 81 squares. Com. (63)	Sirās in a Vāstu of 81 partitions. (60).	Sirā=Nāḍī; the 2 diagonals. (25).	2 diagonals in a 64 squares site from corner to corner are called Sirās. (25-26).	[same as Vāstu-Vidyā] (17).
Anusirā.			The 8 lesser dia- gonals; XI. 24. (37).		
Nāḍī (vein, any tubular vessel).				N. are 10 east and 10 south- wards in the Vāstu of 81 squares. (10).	in 81 squares Vāstu, 10 lines facing E and 10 lines facing S. (2).
Vamśa* (beam, back- bone).	The 2 Vamśas are the main diagonals, i.e., lines drawn from the angles, Roga- Vāyu, Pitr- Agni. Com. (57).	Vamśas are the Koṇa-rajjus. (61).	The orthogonals minus the Mahā- vamśas. (27).	in 64 squares site, the lines running east- wards and north- wards are called Vamśas. (25-26).	[same as Vāstu-Vidyā] (17).
Mahāvamśa.			The border and middle lines. (27).		
Ann-vamśa. Ūrdhva-vamśa.		this name is given to the Prāk-sūtra. (61).	The lesser dia- gonals. (28).	lesser diagonals in a 64 squares site. (25-26).	at the sides of the Sirās. (17).
Rajju (cord).	The four 'lesser' diagonals; (61) and Com. (57).			lesser diagonals in an 81 squares site. (10).	(diagonals) on either side of the Karṇas. (2).
Koṇa-rajju.		Koṇa-rajju= Vamśa. (61).			

* Note the interchange of names of orthogonal and diagonal lines (Sirā or Nāḍī and Vamśa) in the different texts.

THE ORGANISM OF THE PLAN

B. The intersections of the lines in the Vāstupuruṣamaṇḍala.

Paramaśāyika : 81 Padas (squares).			Maṇḍūka : 64 Padas (squares).		
			I	II	III
Name of intersection	Br. S., LII. 62.	Vāstuvīdyā, VI. 8-17.	Samarāṅgaṇa-sūtradhāra, XII. 28-32.	Śilparatna, XIII. 2-10.	Vāstuvīdyā, VI. 25-28.
Atimarma	concurrence of diagonals 9 in number.				
Mahāmarma		conjunction of 4 diagonals and 4 orthogonals at the corners of Brahmasthāna.	6 great (mahā) marmas : Face, heart, navel, head, breasts. (XIII. 6).	where 8 lines, orthogonals & diagonals meet at the corners of Brahmā.	conjunction in head (Īśa), face, navel (Brahmā), 2 breasts (Aryaka and Mahīdhara), heart (Brahmā).
Marma	measures ¼ pada.	meeting places of 20 orthogonals and 10 diagonals; 36 junctions of 3 lines which at the conjunctions appear as 6 lines.	concurrence of orthogonals and diagonals.		conjunction of lines (orthogonals and diagonals).
Upamarma		conjunction of 2 orthogonals 6 in each quarter; altogether 24.	conjunction in the middle of padas (squares).	cf. V.V.	cf. S.S.
Rajjumarma		conjunction of 2 diagonals which appear as 4 at the conjunctions.		cf. V.V.	
Upamarmānta		In corners of Vāstu; conjunction of 3 lines (2 orthogonals, 1 diagonal).			
Sandhi		the conjunction of 2 diagonals (is not avoided).	conjunction of orthogonals; its measure : 1 Bālāgra (tip of hair)		conjunction of 3 lines in the 4 quarters.
Anusandhi		8 conjunctions of 5 lines (in the borders).	conjunction of aṅgas; its measure : ½ Bālāgra.		
Laṅgāla					conjunction of 2 lesser diagonals.

C. Proportionate width of lines and intersections.

	Bṛhat Saṃhitā	Samarāṅgaṇasūtradhāra	Vāstuvīdyā, VI. 25-26
Width of :	In a plan of 81 squares	In a plan of 64 squares	In a plan of 64, 81, 100 squares
Diagonal	1/24 pada	main diagonal : 1/16 pada lesser diagonal : 1/12 pada	
Orthogonal (Madhyasūtras, in V. V.)	1/16 pada	Border and middle lines : 1/10, the other orthogonals 1/8 pada	1/16, 1/12, 1/8 pada
Marma	1/8 pada		
Sandhi	1 Bālāgra		
Sandhis of 'aṅgas'	½ Bālāgra		

While the position of the main diagonals is necessarily always one and the same, from the north-east to the south-west and from the south-east to the north-

west, there are differences in the number and position of the lesser diagonals. As a rule they are drawn in the square of 81 compartments, across the third and sixth compartment on each side; altogether four lesser diagonals are thus drawn, or else in later texts ('Samarāṅgaṇasūtradhāra', XI. 26-29) eight diagonals are drawn. In the 64 compartments only 4 of the lesser diagonals are drawn ('Vāstuvidyā', VI. 25-26).

The 'Br̥hat Samhitā', LII. 61, gives the names of the divinities who occupy the squares in the border of the maṇḍala which are connected by the diagonals. They extend from Vitatha to Śoṣa, Mukhya to Bhṛṣa, Jayanta to Bhṛṅgarāja and Aditi to Sugrīva (Figure on p. 32). The text does not say which of the two corners of the respective squares, on the border line, these oblique lines connect; if it is assumed that the lines are drawn from the meeting of each of the four sides with the third perpendicular on each side, including the border line, the rule holds good for the maṇḍala of 64 and of 81 squares. The 'Br̥hat Samhitā' gives no special indications concerning the square of 64 compartments. If however, the meeting points of each fourth perpendicular line with the respective side line are the points of departure of the diagonals, the names of the divinities must be different in the maṇḍala of 64 squares. This is so in the 'Vāstuvidyā' where the names of the divinities are given through whose plots the lines pass from the 4th point of junction on each side. They are: Br̥hatkṣata to Varuṇa, Bhallāṭa Āditya, Indra to Yama, and Candra to Puṣpadanta.

A widely used manual, the 'Viśvakarmavidyāprakāśa' (83-85) explaining the maṇḍala of 64 squares, enumerates the series of oblique lines from Vitatha to Śoṣa, etc., and supports the statement of Varāhamihira. The difference is that in the texts where the lines are to be drawn from the third point of juncture, the crossing of the diagonals is nearer to the centre than when the oblique lines are drawn from the fourth point of juncture, on each outline. The 9 specially vulnerable points (atimarma) of the 'Br̥hat Samhitā' fall into the Brahmasthāna and immediately around it.

If the corners of the Brahmasthāna are 'mahāmarma' the diagonals would have to be drawn from the crossing of the 3rd perpendicular and the outline, in the square of 64 parts; and from the crossing of the 4th perpendicular and the outline in the square of 81 parts. If this is the meaning, the indications of the 'Br̥hat Samhitā' mean: In a square of 64 parts the diagonals have to be drawn from the crossing of the third line (perpendicular) with the side line. In a square of 81 parts, the diagonals have to be drawn from the crossing of the fourth perpendicular line with the side line. The names of the plots of the divinities remain the same, but the opposite corners are referred to in each case, the one nearer to the corner in the maṇḍala of 64 squares, the one away from the corner in that of 81 plots.⁹⁴

⁹⁴ The diagonals in these 2 cases then would have to be drawn at a distance of the diagonal of one small square in the 64 plot; and of $1\frac{1}{2}$ small squares in the 81 plot; JISOA, I. c., p. 184. The same points of crossing, however, are meant as starting points of the diagonals, in the two types of plans, by the 'Vāstuvidyā', i.e., where the 4th crossing from the corners, is the point of departure of the diagonals, in the maṇḍala of 64 and of 81 squares.

These complexities brought about by the alternate use of the maṇḍalas of 64 and 81 squares, are increased by the reference of the Marmas to the 'body' of the Vāstupuruṣa. They are said to be the head, face, heart, etc. of the Vāstupuruṣa in the plan of 64 squares. The 'Vāstu-Vidyā' gives the names of the divinities where his head, face, etc., come to lie. This distributes the Mahāmarmas between the North-East and the Centre and not around the Centre, as the Vāstupuruṣa should lie with his head in the East in the maṇḍala of 64 squares. Yet the texts quoted put his head in the North-East, a position which the Vāstupuruṣa should occupy in a square of 81 parts. These various assimilations and combinations however are unanimous in their intention. It aims at linking up the building and the plan in which is laid out its meaning. The building draws its power from the Vāstupuruṣa who lies at its base and converts, by his name and presence the Plan of Existence (vāstumaṇḍala) into the shape of the Puruṣa, in whose likeness the temple is set up.⁹⁵

⁹⁵ 'Agnipurāṇa', ch. LXI. 11, etc. ; the Prāsāda as Puruṣa ; 'Viṣṇusamhitā', XIII. 60-70 ; see also Parts V and VIII.

THE SERIES OF 32 TYPES OF THE VĀSTUMANḌALA

While the Vāstumāṇḍala is laid out by the subdivision of the total square, the temple with its parts has its meaning displayed in the opposite direction, from the Centre of the square, the Garbhagrha, towards its perimeter. The Vāstumāṇḍala is a prognostication, a forecast and 'tonic' of the contents which will be built up in the temple; it is in a literal sense, its programme. This does not imply an identity of the actual plan of the temple, with the māṇḍala. The actual and indefinitely varied temple plans have in the Vāstumāṇḍala a prototype; it gives the widest margin to their possibilities. The two generally accepted Vāstumāṇḍalas, of 64 and 81 squares on the other hand are not the only varieties of their kind, but are part of an arithmetical series of 32 plans. It progresses from a plan of one square to one with 1024 square subdivisions, that is having a side length of 32 units. The number 32 is half of 64, and it is 4×8 ; it belongs to the series of 'opposites in balance', to a progression beginning with the simple square of the Pṛthivīmāṇḍala; which is again resolved in every one of the 32 types in the Brahmasthāna, in the middle with its 4 or 9 squares around the central point or in one central and only square.. Thirty two is also the number of the Pada-devatās, arrived at by a subdivision of the border of the square.

Each of the 32 plans has its name. Māṇḍalas 1, 2, 3 and 7, 8, 9 have each their significance; the others are constructed as reductions by analogy or as amplifications of these six plans.⁹⁶

The first plan, called Sakala (commensurable) consists of one square (pada) only. It is ordained for hermits (yati) as seat (vistāra) of the priest for making a great, devouring fire for sacrifices to the Fathers, to the immortals, and so on, and for worship of the Guru; Sūrya, Yama, Varuṇa and Soma are stationed in the East, South, West and North along the cord (which delimits the plot; 'Mayamata', VII. 22). This first type of planned, commensurable plot does not seem to have been destined as site of a temple.⁹⁷ It was an enclosure round the sacrificial fire.

⁹⁶ Of all the texts, the account of the 'Mayamata', VII. 1-32, is the fullest and most lucid. It is followed here. The complete series of 32 types is not acknowledged everywhere. The 32 māṇḍalas are 'āsanas' or seats of different types, of divinity. They correspond in number to the 32 'āsanas' of Yoga practice. The 'Samarāṅgaśāstradhāra', III. 52, considers the māṇḍala of nine squares as the first; or the one of 16 squares (XII. 1) as the least and that of 1,000 squares as the last (XII. 12 and III. 52). The 'Bṛhat Saṃhitā' does not treat of any other plan besides those of 64 and 81 squares. The 'Vaikhāṇasāgama' gives special importance to the 7×7 plan, etc.

The plan of 16 squares is made to accommodate 25 divinities, Brahmā in the centre in 4 squares, surrounded by 8 internal and 16 external divinities, a condensation of the layout of the plan of 64 squares. In the series of plans, the 4th, the one of 16 squares, is the first to show separately the central position of Brahmā. The 'Agnipurāṇa', ch. XCIII. 35-38. prescribes the Vāstu of a country (deśavāstu) as of 3,400 squares (pada); there the Brahmasthāna has 64 squares. The highest number of squares in a Vāstu is given as 20,000.

⁹⁷ Some of the later compilations, as for instance, the 'Śilparatna', VI. 24, are more circumstantial; moreover, this text states that Brahmā has his station there; cf. 'Mānasāra', VII. 54-56.

It is more likely that no hut was originally built on the Sakala plot to enshrine the fire which is described as great and devouring. However, lesser fires might have been kindled for similar purposes, by hermits in the huts in which they also dwelt, or in canopied pavilions, supported on posts and without walls, open on the sides.⁹⁸ The Sakala plan is that of a sacred square field, an 'agni kṣetra'; it is complete though without any structure. The next plot, called Pecaka, consists of four equal parts; 4 types of evil spirits, Piśācas, Bhūtas, Grahas with their poison, and Rākṣasas should be worshipped there. With its homage should be joined the rites which belong to the plot of Śiva unmanifest (niṣkala) and manifest (sakala) according to correct procedure, as prescribed, by those who know the rules (ib. 23).

The first plot, though without parts, is Sakala, complete in itself. In the second type, four kinds of evil spirits are fenced in, for appeasement or worship. With this purpose is combined the worship of Śiva, on the same field. Here Śiva in his commensurable aspect (sakala) covers the extent of the plots of the Bhūtas, etc., of the evil ones, comprehending the four; and at the same time his rites are performed there to Śiva without attributes and qualities and non-manifest (niṣkala). This second type of the sacred field is also without a temple.

In the third type of plan, the Pīṭhapāda of nine squares, the central square is occupied by Pṛthivī, and the 4 Vedas should be worshipped in the 4 directions (ib.; cf. 'Śilparatna', VI. 26) surrounded on all sides by the respective divinities. This plan is an amplified Pṛthivīmaṇḍala; besides, in its construction it is parallel to those of the plan of a higher order. Here it is Pṛthivī, the earth, who holds the central square—"the measure (mā) is this terrestrial world" (Ś.B. VIII. 3. 3. 5)—and not Brahmā, the embodiment of Brahman, the Supreme Principle. In this, the Pīṭhapāda is unique among those plans which have a central plot. The two first plans are without it. They seem to begin the list of plans, as predecessors to planned building.

The fenced off square is a sacred precinct, a 'templum' in which the potency of the Principle is held by being defined within limits. The possibility of seizing it by drawing limits gives to the first plot, its name 'sakala', commensurable. The second type of plan, also commensurable, consists of four parts, full of different potentialities of decay, haunting, survival and evil. They are joint with and submerged in the Śiva Principle which covers them along with its own commensurable aspect. That makes the Pecaka plot the 'couch' on which evil is spread out, within borders which are also those of the Supreme Principle, thought of as commensurable (sakala). For this reason the 'Agnipurāṇa', ch. CCCV. 14, speaks of Śiva being manifested in a quadrangle (catvara). All this refers to rites and worship in an 'enclosure', a fenced off square without any kind of building on it.⁹⁹

One should go on adding one square to the two adjacent sides ('Mayamata', VII. 29) and by gnomonic increase, derive each subsequent plan from the preceding.

⁹⁸ As represented for instance in Sāñcī, East Torāṇa; second panel on the inner face of the left pillar.

⁹⁹ It appears almost as if the elaboration of the Vāstupuruṣamaṇḍala were due to Śaiva activity. This would be confirmed by statements like that of Brahmaśambhu (middle tenth century) that Vāstu whose body is Vāstu is spoken of in Vāstu-śāstras and in Śaiva-āgamas (Ī.P. III. ch. XXVI. 93 f.). Vaiṣṇava texts, like the 'Hayaśīrṣapañicarātra' or the 'Mahā-kapilapañicarātra' represent the identical theme in its general and in this case, Vaiṣṇava validity.

Those of even numbers should be treated according to the Maṇḍūkā plan of 64 squares and those of an uneven number of squares should be laid out in accordance with the Paramaśāyika plan of 81 squares. These two plans, once more are called 'sakala' and 'niskala'¹⁰⁰ which would mean that in either of them, the Supreme Principle should be worshipped beyond manifestation as well as in manifestation, in a temple, symbol or image (mūrti).

The 7th plan is of great importance in the 'Vaikhānasāgama' and other South Indian texts. The Sthāṇḍila of 49 squares has Brahmā in the centre, surrounded by a triple enclosure. The border around the one square of Brahmā is held by the gods, in 8 squares; the next border of 16 squares is assigned to men and the outermost border of 24 squares is occupied by Piśācas, the goblins. This triple enclosure comprising the seven times seven squares (cf. Ś.B. X. 2. 3. 1., the Agni of 7 Puruṣas) and the progression of squares from the 1 in the centre to 8 to 16 to 24 is prescribed for the immovable image of divinity (dhruvārcā).¹⁰¹ (Fig. A). The triple world in its hierarchy of gods, men and ghosts ensconces Brahmā.¹⁰²

A. Sthāṇḍila

B. Padmagarbha

(Fig. A). This scheme is also extended to diagrams of more squares than the Sthāṇḍila. (Fig. B). It lies at the root of the Prākāras, the numerous enclosures of South Indian temples.¹⁰³ The division of the 'plan' in zones around the

¹⁰⁰ 'Agnipurāṇa', XCIII, 30; or else one should worship the entire Vāstu. Here the entirety of the Vāstu is contrasted with its several parts occupied by the various gods. 'Sakala' as an attribute of the one 'pada' maṇḍala also indicates that it is a complete Vāstu, despite the absence of the additional squares.

¹⁰¹ 'Vaikhānasāgama', ch. X.

¹⁰² The 7 fold division of each, heaven, earth and the lower region is given in detail in the 'Viṣṇupurāṇa', II, chapters II-VII.

¹⁰³ The Garbhālaya of 256 squares is similarly laid out with three borders of gods, men and Piśācas: 'Vaikhānasāgama' X. (Fig. B). The Brahmasthāna here occupies 16 squares, the gods and men are accommodated within the Vāstumaṇḍala, the Piśācas are relegated to the

Brahmāsthāna, and assigned to gods, men and demons respectively, according to their distance from the centre, differs from the Vāstumāṇḍala on which the 45 Vedic gods dwell. There, two belts surround the Brahmāsthāna, the one of the 'internal divinities', the other of the Padadevatās and the extent of the plots occupied by each divinity is variable and consequently also the pattern of the plan; here however the three classes of beings are assigned their residence within unchangeable limits. Two different methods of concentration (dhāraṇa) and of site planning, two different traditions are represented in the Vāstumāṇḍalas of 64 and 81 squares on the one hand, of 49 squares, etc., on the other. The latter bears no direct relation to the legend of the Vāstupuruṣa.

He is not 'embodied' in this kind of maṇḍala. It is not occupied by 32 divinities of the border together with the 12 divinities of the interior, surrounding Brahmā in the Centre; the 45 Vedic gods do not dwell in the type of maṇḍala given in Figs. A. and B. In this scheme another tradition based on the enclosures and their number has consolidated into the plan of the temple.

outermost border (IV). The image (sitting or lying) is not placed in border IV. The 'Kāmikāgama', XXIX, 1-2 lays down the same scheme. It holds goods for sites of 'villages' etc. of 100, 81, 64 or 49 squares though with considerable reservations (ib. 9-10) in which a compromise is arrived at of the situation of the gods in the Piśāca border, or of the dwellings of the castes, in the parts of gods and men.

In the Sthāṇḍila plan, the side length is 7 units and the number of squares is 49, the central square is for Brahmā, the zone around it has 8 squares and is assigned to the gods, the border around it has 16 squares and is assigned to men, and the outermost border of 24 squares to the Piśācas. The special significance of this distribution within the square of 7 is that it forms a geometrical progression based on the number 8 which belongs to the Maṇḍūkā maṇḍala. The Padmagarbha plan has no such numerical correspondences. Cf. 'Mānasāra', VII. 20-21 ; IX. 178-180.

VARIOUS CLOSED POLYGONS AS SHAPES OF THE VĀSTUMANḌALA

From the piling of the circular Gārhapatya (śālādvārya) hearth equal in area to the square of a fathom whose centre the Āhavanīya altar had occupied, the construction of a circle equal in area to a square had been carried out in ever renewed practice. The earlier texts on Vāstuśāstra do not record circular Vāstus; Utpala, the tenth century commentator of the 'Bṛhat Saṃhitā' describes in detail the construction of circular sites and also of polygonal shapes of 6, 8 and 16 sides, as well as of three sided Vāstus; and of buildings, villages and towns laid out according to these plans.¹⁰⁴ This appears a development around the principal Vāstu, which is and must remain square, a sacred precinct in any of the varied types of plans. This view is held by the 'Agnipurāṇa' (ch. XCIII. 40). "In the middle of the six sided, three sided, and circular plan, should be the square". In the transfer and application of the division of the square, to that of other closed polygons and to the circle, the activity of the principle is seen at work, whereas in the 'Agnipurāṇa' its immutability is symbolised by the preservation of the shape itself of the square in the very centre of each of the closed polygons.¹⁰⁵

¹⁰⁴ Utpala adds: Meru is six-sided and Samudga round (Br. Sam., comm. on LII. 56) and refers to Varāhamihira's text, ch. LV. 20, where these buildings are described. The 'Samarāṅgaṇasūtradhāra', similarly speaks of the circular Vāstu of 64, and 100 parts, used in circular shrines (XII. 13. f). It has four enclosures and the divinities are distributed as in the corresponding square types of Vāstu: ch. XII. 20 deals with polygonal types of Vāstu of 3, 6, 8 and 16 sides.

The side (asra) in the 'Bṛhat Saṃhitā' belongs 1) to the wall of the Prāsāda, and 2) to its central buttress (bhadrā; Pt. VII); a square plan with projections on three of its sides results; the fourth side is the 'façade' of the temple with the entrance and porch and is separately dealt with (Part VII).

¹⁰⁵ The building site, apart from the possibility of a conversion of its square surface into a circular one of equal area, is yet in another way connected with the circle. A great serpent (nāga) moves encircling every site by its movement in the course of a year. Whatever the name of the Pannaga, it is a manifestation of Ananta or Śeṣa, the Endless (=Ananta), the Remainder (=Śeṣa), which encircles in the perpetuity of its movement, and also supports on its head, the earth and the entire manifest world. On its coils Viṣṇu sleeps, in the intervals between the Kalpas, when every thing else has withdrawn and no other form exists. Uncoiled and proceeding in a circle, it moves from the East, to the South, West and North in the course of a year. When its head is in the East, its tail is in the South, its body covers the North-East, North, West and South. Head and tail do not touch. The head of the Nāga moves one degree every day. ('Vāstuvidyā' VII. 2-6). The Vāstupuruṣa also is said to move. His feet lie in that Rāśi (Zodiacal sign) where the sun stands and his head is on the seventh Zodiacal sign from the Rāśi. ('Vāstuvidyā' VII. 6). Following the sun, as the months advance the Vāstupuruṣa moves. According to Jyotiṣa Śāstra, he lies with his head in the East during three months, in Virgo, Libra and Scorpion and then moves to the South, etc. The solar Zodiac however is not inscribed in the Vāstupuruṣamaṇḍala as given on p. 32.

The Vāstupuruṣa who is one, thus appears in several positions of which the main are the 8 yonis; they are the Vāstupuruṣa at the 8 directions, or the 8 Vāstupuruṣas (Utpala's comm., Br. Saṃh., ch. LII, 73).

The spatial order of the 8 directions simultaneously denotes a temporal order; the Vāstu is the time piece for determining the proper building season. This rotating Vāstu is called

The square Vāstupuruṣamaṇḍala, it has been shown, faces the four directions. Its borders are occupied by the 8 regents of the cardinal and of the intermediate points. At the same time this square diagram of the earth, ordered by time, in its extent, coincides in the maṇḍala, with the Ecliptic; in its border are accommodated the planets and the stars, and the movements of sun and moon. The Vāstumaṇḍala is the place of manifestation; it shows the order that rules over it; cyclical time on earth, is occupied in its entire extent, by the Vāstupuruṣa. The Vāstumaṇḍala indeed, is the Vāstupuruṣa. His coming to earth and his identity are described in several versions; in all of them, the whole square field is the Vāstupuruṣa whose body is one with the presence and actions of the 45 Vedic gods, stationed in the Vāstupuruṣamaṇḍala, which is their yantra, the means of realising and the symbol of cosmic order on earth; its centre is the Brahmasthāna, and its superstructure is the temple.

Caravāstu and is distinguished from the Sthira-vāstu, whose position is fixed ('Vāstuvidhāna', X. 15). His head is said to lie always in the North-East.

The connection of the Vāstu with the ceaseless circular motion of the serpent shows ordered extension clasped by the time world, and carried in its movement. For all permanent work (sthirakārya) the Sthiravāstu is to be worshipped, and for all impermanent work (carakārya) such as the habitations of man, or the setting up of a liṅga made of clay, the Caravāstu should be worshipped (ib. 16). Temples are meant to last and are always built on the Sthiravāstu.

“Om, I bow to the holy Vāstupuruṣa of great strength and valour
Whose body rests under all dwellings, Son of Brahmā,
Upholder of the entire Universe,
Whose head is placed to carry the burden of the earth,
Who makes all sites [receptacles of] his presence,
The towns and cities, temples [and palaces], houses, tanks and wells,
Who assures all kinds of fulfilment,
Of gracious appearance,
Support of the Cosmos,
Supreme Puruṣa,
Granter of boons to Indra,
Lord of dwellings, Obeisance.”

‘Paurāṇikavāstuśāntiprayoga’, Fol. 25.

III

PLAN AND SUPERNAL MAN

The Vāstupuruṣamaṇḍala is the magic diagram (yantra) and the form (rūpa) of the Vāstupuruṣa ('Vāstuvidhāna' of Nārada, VIII. 26-32). It is his body (śarīra) and a bodily device (śarīra yantra) by which those who have the requisite knowledge attain the best results in temple building. It is laid out in tabular notation as man and site (naraprastara, vāstuprastara; ib., 29).

In the Puruṣa, Supernal man, the Supreme Principle is beheld. Beyond form and non-contingent, it is beyond description. It is known by intellectual intuition as residing in man, the microcosm, and in the universe, the macrocosm. Either is its place of manifestation. Man and Universe are equivalent in this their indwelling centre. Of this equivalence the Puruṣa is an image. In the Puruṣa, the relation of the Supreme Principle (Brahman) and of manifestation is seen as coterminous. The Supreme Principle in this aspect is called Puruṣa because it reposes or dwells in Integral or Supernal man as if in a city (Puruṣaḥ = puri-śayaḥ or puri-śādaḥ; Yāska, 'Nirukta', I. 13; II. 3). The city is drawn as a yantra, a device in which is bound and situated the Supreme Principle. It is a plan of its manifestation and as such it is also the body of the Puruṣa, itself without substance. It is the site indwelt, and pervaded by the Puruṣa. Any place where this body lies down, where this plan is laid out by those who know it, exemplifies the presence of the Puruṣa and is its 'bhūmi', the ground on which it rests.¹ By its impress that piece of land, freed of all associations acts as primordial, undifferentiated substance (Prakṛti).

"He is praised as Vāstubrahmā who is made first by Virāj" ('Vāstuvidhāna', VIII. 14). "Puruṣa alone is this entire world, both past and future. From him was born Virāj, and from Virāj was born Puruṣa" (RV. X. 90. 5).² Virāj is cosmic Intelligence ruling over universal manifestation in its integrity under which is seen the activity of the Puruṣa, who himself is actionless; Virāj is the conditioned Principle, issued or born from the Puruṣa, the original impulse towards universal manifestation and refers back to Him; the knowledge of His presence is derived from His appearance as participator and director of the performance; the 'bhūmi'

¹ Bhūmi is the support on which are established all beings and things (Sāyaṇa, on 'Taitt. Ār.' III. 7. 1).

² Trans. W. Norman Brown; 'The sources and nature of Puruṣa in the Puruṣasūkta', JAOS, vol. 51, p. 116.

is the stage. On it the directing, universal intelligence, has the form of Vāstu-Brahmā; It enters and fills the Vāstu, the site or stage of the building activity of man.³

The play of manifestation is not a passion play; the sacrifice in which the Puruṣa is the offering is performed on the 'bhūmi'. "With the sacrifice the gods sacrificed to the sacrifice" (RV. X. 90. 16). Part by part the Puruṣa sacrifices himself into existence, the gods are born from him, from his mind the moon, from his eye the sun, from his mouth the fire, from his breath the air and from his feet the earth. His being is given up to them and spent in them as far as he enters into manifestation; in as far as he is an active part of this all offered sacrifice of himself he is called Prajāpati, lord of progeny (prajā), totality of existence. He spends himself in an ever renewed, ever proceeding sacrifice by which the universe subsists. It takes place in time; time fathers it; is one with Prajāpati (the year; Ś.B. VII. 1. 2. 11) and by his own sacrifice outlasts death, the principle of all form, of all that has definition and thus is finite.⁴

AGNI-PRAJĀPATI AND VĀSTUPURUṢA

Prajāpati is offered up anew in every sacrifice; and inasmuch as the very dismemberment of the Lord of creatures which took place at that archetypal sacrifice, was in itself the creation of the universe, so every sacrifice is also a repetition of that first creative act.⁵ The Yajamāna, the sacrificer, who is the performer or patron of the sacrifice, by performing it becomes identified with Prajāpati by building up his body,—the altar,—just as the gods had done in the beginning when they restored Prajāpati, exhausted in creation.

As they had done in the beginning, so is required a new and ever renewed sacrifice to build up the body of the Lord of creatures exhausted and dismembered by his sacrifice, and by the sacrifice renew the body, restore the Lord of creatures

³ Vairāja Puruṣa or Pradhāna Puruṣa is the non-conditioned, Supreme Principle in its contingent aspect, in the macrocosm and microcosm; Vāstu-Brahmā stands here in analogical relation to Virāj as Virāj to Puruṣa. In the 'Samarāṅgaṇasūtradhāra', II. 4, Viśvakarmā says, "Brahmā created first Vāstubrahmā and then all the worlds." The principle which regulates extension is prior to extension. The world is laid out in conformity with the principle. This is shown in the ritual diagram of architecture and in the building of the temple, which is a likeness, on a proportionate scale, of the world and leads beyond it.

⁴ Ś.B. X. 4. 2. 2. "Prajāpati, the year has created all living beings and things, gods and men; having created all he felt like one emptied out and was afraid of death";—Ś.B. X. 2. 6. 4 (end): "Beyond the year lies the immortal." Ś.B. X. 4. 3. 3. "The gods were afraid of this Prajāpati, the year, Death, the ender." Ś.B. X. 4. 3. 8. "Prajāpati then spoke: Lay ye down 360 enclosing stones and world filling (lokamprṇā) [bricks], lay ye down 10,800 and ye will be laying down all my forms and will become immortal." $10,800 = 360 \times 30$ (muhūrtas in the year; one muhūrta is 48 minutes) $= 135 \times 80$ (the amount of 80 of which the 3 Vedas consist, the sum total of knowledge and existence). "The self-offerer knows: This my body is formed by those parts (aṅga) of the sacrifice (Ś.B. XI. 2. 6. 13); this my new body is procured thereby."

⁵ SBE. vol. XLIII. Introduction.

and keep up the unbroken sequence of an ever renewed universe in the analogy of the year that spends itself in its productiveness and out of its death arises anew. In building up the sacrificial body, the altar, the sacrificer in so doing becomes the very altar itself; he builds for himself a sacrificial body and by doing so he is beyond time and death.⁶

He builds up the altar in the likeness of the Universe and in accordance with his measure (vyāma). By this link it is his, a transformed, sacrificial body (Ś.B. I. 2. 5. 14; Āp. Ś.S. XVI. 17. 8).⁷ Built into it at the same time is another measure, that of time. Measure is expressed by number. As many seasons as there are in the year, so many layers has the altar; and further, the total number of the surrounding bricks of the requisite altars is 360. By number the year is built into the altar and is its substance. This is reinforced with grosser identities; the sacrificial victim, man and his successive substitutes (Ś.B. I. 2. 3. 6-7), horse, bull, ram, and the goat, mingled in the mortar, their heads originally having been placed in the first layer of the altar⁸; built into, and one with the substance of the altar, the sacrificer, as victim is his transformed self in the symbol of the golden man immured in the altar. In gold, purest of all substances, man (puruṣa) the sacrificer, is one with the Puruṣa; their conjoint effigy, the golden figure, is sacrificial man; symbolical, without arms; the arms are the sacrificial spoons laid down on either side of the golden man. Were arms made, this would be redundant.⁹

The sacrificer puts down the golden man, laying him on his back (uttāna). He lays him down with his head towards the East, for (with the head) towards the East this Agni (the Fire altar) is built up (Ś.B. VII. 4. 1, 15; 18).¹⁰

The Fire altar is oriented towards the East, the direction of the sunrise, the ever new beginning. It is piled up, a square to start with, facing the four regions and the one above. They are bodily parts of Prajāpati, the year.¹¹ The altar is built of bricks. They are Agni's limbs, his joints (Ś.B. VI. 1. 2. 31). Similarly, the area between the Āhavaniya and Gārhapatya altar has two 'spines' (Ś.B. VII. 1. 2. 14), the middle lines from East to West (the prāci which is the 'prṣṭhyā', Ś.B. III. 5. 1. 9) and the other from South to North. When Agni is laid down as the Gārhapatya hearth, the four bricks in the middle, are the body. Two at the back are added: these are the thighs and two in front, the arms; where the body is that (includes) the head (Ś.B. VII. 1. 1. 18).¹²

Agni, the sacrificial fire and the place where it is lighted are one. The altar

⁶ Ś.B. VIII. 5. 2. 16. "This then, is, as it were, an ascent away from here; but this earth is the foundation."

⁷ "Let the altar measure a fathom (vyāma) across on the western side. That namely is the size of man and the altar should be of man's size." 'Tait. Samh.', V. 2. 5. 1. "With man's measure he metes out; man is commensurates with the sacrifice."

⁸ Ś.B. VII. 5. 2. 1.

⁹ Ś.B. VII. 4. 1. 45; 'Taitt. Samh.' V. 2. 8.

¹⁰ 'Kātyāyana Śrauta Sūtra', XVII. 4. 10. The sacrificer is to lie down so as to cover the gold man; this rite of identification is allusive by its performance as the gold man is by its form.

¹¹ They are five in number; the 4 regions and the upward (Ś.B. VI. 1. 2. 19).

¹² With reference to man, the microcosm, and his body, the several classes of bricks laid down in the layers of the Agni, are explained in Ś.B. VII. 5. 1. 35. The Svayamātrṇā, the lower immanent breaths; the Dviyajus, the hip; the Retahsic bricks, the ribs; the Viśvajyotis

with its structure, with its fire, is called Agni. Its function is to carry up the sacrifice, so that it reaches its destination beyond time and death. The Fire is the actual performer of the sacrifice in which it is assisted by the sacrificer; his sacrificial self is one in nature with the burning flame; it consumes the lower self of the sacrificial victim; Agni is the sacrifice of the Yajamāna, and of Prajāpati, the year, of the contingent aspect of the Supreme Principle. Agni, whose emblem is the flame consumes itself, as sacrificial victim. He 'enters' the five animals, or sacrificial victims, man, bull, horse, ram, he-goat. He becomes those five animals (Ś.B. VI. 2. 1. 2-3). The conversion of their natures imbues the bricks which form Agni's limbs and joints.

The goat is the last of the sacrificial animals. Into it has passed the sacrificial essence of man from whom it went to the horse; and then to the bull, and finally to the he-goat. The goat remains the sacrificial animal, the victim for all others, the animal consumed by and transformed into Agni. It is Agni, who is sacrificed as animal victim (Ś.B. XIII. 2. 7. 13; 'Vāj. S.' XXIII. 17). "Agni was an animal. They sacrificed him and he gained that world wherein Agni (ruleth); That shall be thy world, that thou shalt gain". The goat is the animal-form of Agni; it is produced from Agni's heat (Ś.B. VII. 5. 2. 36). This is Agni's heat and also that of Prajāpati. The he-goat means Prajāpati. Prajāpati, the finite form of the Puruṣa, is one with Agni and the Fire Altar (Ś.B. VI. 1. 1. 5), and as all-offered, self-offered victim he is one with the goat, which as accepted offering, burnt up in its animal nature and transmuted substance, is un-born' (aja), uncreate.¹³ It is from there that the gods went to the Godhead, to the summit (Ś.B. VII. 5. 2. 36).

The identification of the sacrificer and of the act and material of the sacrifice with Agni-Prajāpati or Puruṣa manifested, rests on a middle term¹⁴ which comprises the structural altar and the sacrificial victim. The building of the one and the transmutation of the other are the means by which is cancelled the initial disintegration which is the beginning of the universe. Prajāpati having spent himself and fallen down exhausted, is re-built. The work of architecture is one of restoration of his body. The body of Agni-Prajāpati is a universal symbol. Its images are those of the first and last of sacrificial victims, man and goat; while bricks, and parts of the victims are embedded in its gross substance, number and measure constitute the subtle substance of its plan and structure. By its number it is a monument to time which is regulated, bounded and overcome. In the extent of the Fire altar, time going round is caught, embodied and mastered in the identity of the sacrificer and Agni-Prajāpati laid out from East to West.

bricks, the breast-bone; the Ṛtava bricks between the shoulders, the Āṣāḍha, the neck, and the Kūrma, the head.

¹³ Speech is Aja, "uncreate". Speech, the Word is the Veda, Primordial Knowledge, which is 'unborn' and eternal. The letters of the alphabet are articulate sound and are the body of the word. The 51 letters of the Sanskrit alphabet are known to be distributed over India, as Pīṭhas of Śakti. As signs which stand for articulate manifestation in its several degrees and parts, the letters (of the rhythmic formulae, mantra) are inscribed in ritual diagrams (yantra). Re. the letters inscribed in the Vāstupuruṣamaṇḍala, see 'Samarāṅgaṇasūtradhāra' XIV. 32-35. 'Tantrarāja-tantra', 'Manoramā', comm. XXV. 8-10.

¹⁴ P. Mus, BEFEO. XXXIV. p. 234.

The symbolism of the Vedic altar, Agni, is continued in the Hindu temple, in its plan. The Vāstupuruṣa of this maṇḍala is indeed Agni-Prajāpati. It is drawn on the ground and not piled up. No fire burns on it; the temple is set up on it. The image of the Vāstupuruṣa coterminous and one with the maṇḍala is drawn in the likeness of man. His head lies in the East, in the maṇḍala of 64 squares, the legs opposite; body and limbs fill the square. No bricks are laid down which had been identified with the several parts of his body. The bricks were square; now squares are drawn, lines separate and connect those parts and limbs and are their joints and vital parts. These must not be hurt. The lines too (nāḍī), belong to the anatomy of the subtle body of the Vāstupuruṣa, they are channels of energy as the nerves are and the arteries in the gross body. Their prototypes are Prāṇa and Vāyu. The spine (vaṁśa) of this Puruṣa of 64 squares, is the middle line of the plan of the temple, as it is of the altar.

THE SUBTLE BODY OF THE PURUṢA AND ITS PICTURES

In the net of this plan the figure of Man is caught, not by its likeness, but by its proportion and symmetry in its parts, the "head" confronting directly the aim of his being (the East, where the sun, light of consciousness, arises), the feet at the opposite end, a schematism in which the figure of Man is seen fitted into the square plan of the extended universe. It consists of name and measure. Such a picture or image (pratimā) is a workable and not necessarily visible, analogy, not of the human being but of the order by which it is upheld. Its diagrammatic field of co-ordinates, intersections and diagonals is sensitive to any interference with its order and in this respect it functions like the subtle body of the human being.

Such constructions have wide currency in Indian thought where they signify the universal law as a working entity. For the sake of identification and reference, the whole of it and its parts are placed and named according to the parts and limbs of the human body. Puruṣa in these 'images' is a term of reference. It affords a means of location of the several parts within the whole; and an identification by transfer of one's own bodily frame into the special design as well as an introduction of that image into the corresponding disposition of one's own body. The body here means nothing but a place of co-ordinated activity, each part being the seat of a special function.

The reference to the 'figure of man' as a place of co-ordinated function, is made factually and repeatedly in Brāhmaṇism and Buddhism, in sacred texts and works of art. The 'Āpastamba Śrauta Sūtra', XV. 15. 1. for example prescribes that a figure of man be laid out composed of the ritual implements of the Pravargya sacrifice. Three cauldrons form the head, the milk buckets the ears, and other sacrificial instruments and objects are the various parts of the body.

Similarly, the presence of Buddha is referred to in reliefs in Sāñcī (North gate, left pillar) and Amarāvati by the following allocation: footprints, at the place of the feet¹⁵, life-tree or pillar as trunk and axis of the body, wheel (cakra), etc., as head and sun-shade (chatra) above it.

¹⁵ In Amarāvati, the throne is added, above the footprints, to this symbol of "total manifestation". See Coomaraswamy, 'Elements of Buddhist Iconography', Pl. I. 2, etc.

The Puruṣa of the 'Puruṣa Sūkta' is the archetypal, all embracing term; in its analogy are drawn the specified Puruṣas and the corresponding diagrams of universal time and situation such as the Ātmapuruṣa who is Duration,¹⁶ the Kālapuruṣa¹⁷ who is Time and whose surface is outlined as that of man and marked in its extent by the signs of the Zodiac. The Nakṣatrapuruṣa¹⁸ correspondingly contains the signs of the lunar asterisms, and other star pictures, such as the Śiśumārācakra,¹⁹ this Puruṣa is related to the Vāstupuruṣa. With the star pictures, the description of the Vāstupuruṣa as support of the building has one trait in common: he is described as lying with his face turned down, to the ground, whereas Agni Prajāpati of the Vedic altar lies facing upwards. Dhruva, the Pole star, is described as moving with his head downward round the summit of Sumeru, as if looking at it.²⁰ If the reconstructed Agni Prajāpati faces upward, this connotes "an ascent from here" (Ś.B. VIII. 5. 2. 16), an aspiration towards and attainment of the higher region. From there Dhruva looks down, his face turned to the earth.

¹⁶ 'Viṣṇudharmottara', as quoted by Alberuni, 'India', vol. I. ch. 32, p. 321.

¹⁷ 'Brhājāta', I. 4.

¹⁸ 'Brhat Saṃhitā', CIV. 1-5; 'Matsya Purāṇa', LIV. 7. The Nakṣatra Puruṣa Vrata is worship of Nārāyaṇa. In the rites of the 'moon-vow', the Candra-vrata, the Moon, Lord of the Nakṣatras, is beheld as Puruṣa. The rite is performed when Candra is joined with the asterism Mūlā: when his feet are joined with Mūlā, his legs in Rohiṇī, knees in Aśvinī, thighs in the 2 Āṣādhās, etc. 'Mahābhārata', XIII. 172. 3-10.

THE DESCENT OF THE VĀSTUPURUṢA

A descent, a down going, further and further remote from perfection is the process of this world-age. The initial disintegration from which the world has its beginning is known not only as a dismemberment but also as a descent, or falling off, from the Supreme Principle and a coming to earth. This is told in the many versions of the story of the coming to earth of the Vāstupuruṣa.²¹

In principle, it has its parallel in the falling to earth of the severed limbs of the dead Satī. All over India, wherever a part of her dismembered body fell, Pīthas come into existence. All of them together represent the wholeness of India as a sacred land. In a map of the sacred geography of India each Pītha would have to be marked by one of the letters of the alphabet, of which there are 51 in the Sanskrit alphabet, symbols of lettered sound and of the Word. The Vāstupuruṣa in his fall, defeated, yet whole, on coming to earth, acquires the shape of his yantra to which are assigned 16 letters of the alphabet.

The 'Br̥hat Samhitā' (LII. 2-3) narrates : Once there was some existing thing (sattva)²² not defined by name, unknown in its proper form²³ it blocked heaven and earth ; seeing that, the Devas (gods) seized it of a sudden and laid it on the earth face downwards. In the same position as they were when they seized it, the Devas stayed on it where it lay. Brahmā made it full of gods and called it Vāstupuruṣa. The commentary adds : Br̥haspati says : In the Kṛta Yuga there was a Bhūta "Existence" ; it spread through the 14 worlds.²⁴

The gods assaulted the Thing, put it down, and settled on it.²⁵ They came to live on it for ever, and this twofold Thing, Brahmā called Vāstupuruṣa, the Puruṣa of Vāstu.

Cosmogonically, this is a story of the first appearance of Existence ; once it is, it is unprincipled yet all filling for to it nothing save itself seems to exist—whereas the very fact of its existence is possible only in that there is something outside it.

²¹ The story of the origin of Vāstupuruṣa is not unanimously told, see p. 77.

²² Sattva ; Bhūta ; these are the two words which designate the Vāstupuruṣa before he received this name. They are translated as "Existence", (thingness), Sattva becomes Vastu ; and Vastu, existence, substance, becomes Vāstu, a residence and building site.

²³ Comm. of Utpala : "Kimapītyanirdiṣṭānāmā aparijñātasvarūpa". Kern, JRAS. 1873, translated ch. LIII. 3 (for LII. 3) "being of immortal substance", and Vāstupuruṣa as "dwelling house personified". This is not according to the text, or the commentary : the being (sattva) is nameless and unknown in its very self or proper form.

²⁴ The 14 worlds are the seven lower, and the seven upper regions ; The 7 Pātālas beneath the earth rest on Śeṣa (Viṣṇu) ; above these are the seven spheres of the earth, the air world, the Heaven world, and the Higher spheres (Bhūloka, Bhuvarloka, Svarloka, Maharloka, Janaloka, Tapoloka and Satyaloka ('Viṣṇupurāṇa', II, V and VII).

²⁵ The fall from being into existence (sattva ; bhūta) was a struggle of long duration, one of many in the war of Devas and Asuras, Titans and Angels, gods and demons. The 'Manu-śyālayavidhi' (printed in Malayālam) tells of the Bhūta filling the extent of the universe with his body during the Tretā Yuga. According to the other texts however the descent took place already at the end of the Kṛta Yuga, the Golden age.

As Existence goes down, this 'outside' is above it, it is the gods; and its own place is down below them, and its area is as large as they can stand on. They give it definition. Brahmā finally settles it and gives it its name in the acquired shape from the conflict and its solution.

The gods had raised Prajāpati who had fallen exhausted, having discharged from himself the entire universe. (Ś.B. I. 6. 3. 35-37; 'Pañcaviṃśa Brāhmaṇa', IV. 10. 1; VI. 5. 1). But the nameless thing of undefined shape, altogether unknown in its nature is not procreative; it looms large, swollen by its power, which in the end is converted into a base on which the gods have their perennial stand. This is their work.

It is prescribed that they have to be strengthened and confirmed in their task by repeated sacrifices and offerings before a temple is built and even after. Vāstupuruṣa too must be appeased at every new undertaking in connection with the building which he will have to carry. The peace obtained by Vāstu on earth, with the concurrence of the gods, is a settlement in the beginning. This ordinance however retains its validity only by an ever renewed rite of Vāstusānti.²⁶ In it the Yajamāna, the builder or patron, (kāraṇa), in his ultimate aim is brought into communion with the Vāstupuruṣa. The Kāraṇa has been made aware that he is one with the Vāstu, by different magic signs and warnings felt in his body, prior to the drawing of the Vāstupuruṣamāṇḍala. Now, by the repeated rite of Vāstusānti he gives peace to the Puruṣa "Existence", which this Puruṣa needs in order to endure. It is communicated to him through the gods on his body who are his surface and outer covering and through the builder, by the performance of the prescribed rites.

The ritual restoration of peace to the Vāstupuruṣa is to be performed recurrently, from the beginnings of any architectural work. The firmness which is so essential a requisite of the building ground, is now produced on the subtle level of the Vāstupuruṣa. It is the stability of Existence being at peace with itself. The rite of Vāstusānti and the ensuing building activity itself are acts of liberation. They are performed by the priest (sthāpaka), the architect (sthapati, kartṛ) and the builder (kāraṇa) in collaboration.

Neither through the sacrifice nor as the play (līlā) of the Supreme Principle is the Vāstupuruṣa come into existence and laid down. Descent and dichotomy, fight, defeat and purpose in being defeated so as to sink to the bottom whence every building activity is to arise, is the function of the Vāstupuruṣa. For he came to earth in the Kṛta, the perfect age, when there were neither buildings nor temples, nor images; then the gods could be seen eye to eye, directly (pratyakṣa).²⁷

The story of the 'Bṛhat Saṃhitā' is amplified in the 'Matsya Purāṇa'.²⁸ The

²⁶ Vāstusānti and Vāstuhoma, the rites of appeasement and offering to the Vāstupuruṣa are described in detail, in 'Īśānaśivagurudevapaddhati', III. ch. XXVII; JISOA, Vol. IX. pp. 162 f.

²⁷ 'Viṣṇudharmottara', Part III. ch. XCIII. 1.

²⁸ 'Matsya Purāṇa', CCLII, 5-19. Versions of this account are also given in the 'Vāsturajavallabha', II. 1; 'Manuṣyālayacandrikā', II. 27-28; 'Mahāmanuṣyālayacandrikā', Comm. 'Sārāthadarpaṇa', p. 31. In the last named version, Śiva-Rudra fights Kāla. The sweat of Śiva or of Bhārgava is produced by fiery heat (tejas) or wrath. In this sense it is also said that Sāvitrī, the mother of the Veda was born of the sweat of Kālī's body.

Bhūta, Existence, is said to be born of the sweat of Śiva who causes (kāraṇātmā) the dual creation (dvaitasṛṣṭi) when he fought the demon Andhaka (Blindness). The cause itself (kāraṇarūpa) is Tamas, Darkness in which lives the demon Andhaka; it is the quality inherent in the fall from the Principle which Manifestation or the world of duality, implies.²⁹ The fall from the principle is embodied here in the demon Andhaka; in order to fight it a corresponding tendency is expelled as sweat from the body of Śiva. This is the birth of Undefined and Nameless, the Asura.

In some of the later variants of this version, Undefined and Nameless is described as Asura, full of power and pride.³⁰ Asura, however, is the Supreme Being, in the Ṛgveda³¹ and is transferred, like the name of Puruṣa itself to the Vairāja Puruṣa and other aspects of the Puruṣa, and to the manifested Deity, under the name of Indra, Agni, or Varuṇa. In a continued descent from the Principle, Asura becomes the name of those fallen from the Principle and who are demons.³² So 'Existence' is an Asura fallen by his pride.³³

The story of the fall of the Asura is told with a further variation and in detail in the 'Īśānaśivagurudevapaddhati'.³⁴

"In former times, in the war between the gods and the Asuras the Asuras were destroyed; they were crushed by the gods with Puramdara at their head, through the greatness of the power of Viṣṇu. Their Guru, the son of Bhṛgu,³⁵ who was of an impetuous disposition, became highly incensed and sacrificed a goat with auspicious marks as an oblation in the fire. That goat became a goat-headed Asura through the sweat which fell into the fire as he was offering the oblation. It rose (from the fire) covering earth and sky with its body of horrifying dimensions and asked the great sage "what shall I do?" The son of Bhṛgu replied to it, as it loomed terrifically: "Expel from heaven the gods whose minds are dull". Thus spoken to, it rushed at the gods intimidating them with roars, and scorching, as it were, the three worlds with the flames that issued from its mouth. In fear, the gods with their troops expelled (from heaven) approached Śambhu, the all pervading and fearless one, who is decorated with ashes. They were completely routed by their defeat by the son of Bhṛgu; Śiva, their protector, ordered the

²⁹ "Asūryā nāma te lokā andhena tamasāvṛtāḥ": Those worlds are called 'asūrya' (where the sun does not shine and which) are covered with blind darkness. 'Īśāvāsya Upaniṣad', 3.

³⁰ 'Manuṣyālayacandrikā', 1. c.

³¹ RV. VIII. 42. 1; the 'māyā' of the Asura, X. 177. 1; V. 63. 3; 7.

³² Coomaraswamy, 'Angel and Titan; An Essay in Vedic Ontology', JAOS, vol. 55. p. 384, with reference to Indra, says that he "remains an angel even in his pride, being like Satan fallen not in nature, but in grace."

³³ Pride is the innate disposition of the Asura, the Titan or demon (āsura-bhāva). By it they fall or were driven from heaven.

³⁴ 'Īśānaśivagurudevapaddhati', III. ch. XXVI. 93 f. JISOA, 1. c. This version is repeated in the 'Śilparatna', VII. 4-29; 'Vāstuvidyā', IV. 47, comm. and appears known to the different account in the 'Skandapurāṇa', Nāgarakhaṇḍa, CXXXII. 9.

³⁵ Bhṛgu is the son of Varuṇa (Ś.B. XI. 6. 1. 1.); born of Varuṇa's sacrificial fire (Mbh. Ādi. V. 7-8; 'Manu', V. 1.). He studies sacred science, believes himself above his father, above everything. His son becomes the Planet Śukra; his story is interpolated in the 'Īśānaśivagurudevapaddhati', see infra. He is the priest of the Asuras.

Fire which issued from his third eye in the shape of a spirit (bhūta), to save them. "Thou should burn the cruel and over-grown goat-Asura after having crushed the son of Bhṛgu."

Thus spoken to, the fire chased the son of Bhṛgu, without rest, and he fled pursued through the three worlds. He found no refuge but in Śiva who is 'decorated with ashes'.

Then by the power of Yoga he made his body small and for protection entered the body of Śiva through the ear. When he reached the belly of Śiva, he saw the whole universe rested there confidently, and took heart. The three-eyed god, in his divine sight, saw him take shelter and without surprise he said to the sage with a smile: "Fear not, O Bhārgava, I am pleased with thy diplomacy. Having stayed within me you are my son; now come out at your pleasure. I have bestowed on you the great sovereignty and supremacy among the planets. In these three worlds, you shall ever regulate justice and injustice, rain and draught". . . . Saying so, the three-eyed (god) discharged him through the semen-passage. Thence he got the name Śukra (Semen). Then Śukra, knowing his own desire, bowed to the Lord and submitted. "Contented am I; favoured am I; who is more fortunate than I; I have thus been graced with favour by the God of the gods".

To the Brāhmaṇa Śukra, lying prostrate in salutation after saying so, the Lord, the all pervading, with the crescent moon upon his brow, being pleased, said: "Ask another boon". Śukra (now) also made the frightened goat-demon prostrate himself before Śiva and ask for protection. To the fallen demon lying like a stick, dejected, with his face to the ground, he said pleased: "I grant you protection, and also the boon which is desired by you, O goat". Thus addressed by Śambhu the Asura said respectfully: "May you pardon me the evil deeds perpetrated by me through ignorance so that I may through your favour dwell on earth with the concurrence of the gods. Grant me this boon. The gods, Brahmā, and the rest should be worshipped while residing in me." Hearing this, the carrier of the trident (Śiva) said: "As you have asked me for a residence (vāstu), as a boon, your name will be Vāstupa (protector of 'vāstu'). So be it. (Derived from the root 'vas' (meaning 'to reside'), reside now on earth (Vasundharā); and the gods Śātānanda (Brahmā), and the rest will be pleased to reside in you; henceforth, whosoever builds a divine or human residence, to dwell on this earth, should first worship you with flowers, incense, lights and special tribute (bali). You and the deities residing in your body should be worshipped in proper order. Prosperity comes to those who perform the worship of Vāstu laid down by myself and who reside in those buildings and houses. May the temples (and palaces; prāsāda) and the houses (bhavana), etc., which are built without performing the worship of Vāstu, and all that is done there, be demon's work. Thus the god (Śiva) granted boons separately to Śukra and to Vāstupa, and engaged gods to reside in him; and vanished thence.

Through the boon of the Lord, the all pervading, the place thus oriented by the fall of the Asura, at Śukra's command, before Śambhu, became immediately the abode of the deities.

In the same way even to-day, Vāstu lies on the earth with the head towards the north-east and the face turned to the ground. Thus, as the desired boon was

obtained by Vāstoṣpati from Śiva, so his worship is desirable while building Vimānas of both gods and men."³⁶

In this version, narrated in the 'Īśānaśivagurudevapaddhati', the 'fall' is the sequel of an Ābhicārika³⁷ sacrifice. The Chāgāsura, risen from Bhārgava's fire, pervades the worlds.³⁸ He is produced from the heated energy (tejas) and intentness (tapas) of the Bhārgava. Bhārgava is the son of Bhṛgu, who was born of Varuṇa's sacrificial fire. Out of this fiery conjunction, the sacrificial animal, the goat arises, invested with Asura-power.

The goat replaces man as 'sacrificial animal'. The sacrificer offers his own (lower) self in the sacrificial animal consumed by the fire. The goat is the contribution, of the heat of intentness (AV. XVIII. 2. 8). As a sacrifice it reaches its fulfilment and true state, in the fire and is 'produced' from the heat of the sacrifice (Ś.B. VII. 5. 2. 36). It is Prajāpati (Ś.B. V. 2. 1. 24) and is Agni³⁹ and also 'born from Agni' ('Tait. Samh'. V. 2. 9. 4). Agni was generated by Atharvan (RV. X. 21. 5), the ancient priest, the first to obtain fire.

The 'Skanda Purāṇa', ib., CXXXII, 15, says: "the Bhūta is born from the hymn (sūkta) of Atharvan and the drop of nectar."⁴⁰ The reference of the 'Skanda Purāṇa' is to Atharva Veda IV. 14. 1-3. "Since the goat has been born from the heat of Agni, it saw (its) generator in the beginning; by it the gods in the beginning attained (their) Godhead; by it the sacrificial ones ascended the ascents". "Stride ye with the fire to mid-air, having got to the back of the firmament, to heaven, sit ye mingled with the gods". "From the back of the earth I have ascended to the atmosphere; from the atmosphere I have ascended to heaven; from the back of heaven I have gone to light."

The sacrificial goat born from Agni's heat carries the gods and the sacrificer upwards, to heaven and to light, in the Sūkta of Atharvan; the goat-Asura born from the Sūkta, swelled by pride sinks down and on him the gods take their stand and the temple is built up; with its plan it leads to the centre, and in its elevation to the upper worlds, and beyond them. The Āsura-bhāva (pride) of the Chāgāsura lays him low, "at the feet of Śiva" on the surface of the earth. Yet even so he carries the gods.

Further on the Sūkta of Atharvan continues: "In the eastern quarter set thou the head of the goat; in the southern quarter his right side" (AV. IV. 14. 7). The goat is laid in the position of Agni, which it is; and also of the Vāstupuruṣa which name is given to the goat-Asura on his having settled down in that position.

³⁶ Vimāna means to 'measure asunder'; a building proportionate in its parts.

³⁷ Ābhicārika or 'black magic' rites are performed with the purpose of injuring one's enemy.

³⁸ "Encompassing" growing from the fire, at another occasion, assumes the shape of Vṛtra, the concealer, who is ophidian in appearance. 'Tait. Samh', II. 5. 2. 8. Ophidian, or goat-headed, the Asura arisen from a magic sacrifice, pervades the universe and must be defeated and assigned its place. Śukra (Bhārgava) the priest of the Asuras himself is descended from fire-born Vṛtra, for Bhṛgu, his father is born from Varuṇa's sacrificial fire, and Varuṇa and Vṛtra are equivalent (see Coomaraswamy, 'Angel and Titan', l. c. ; p. 409).

³⁹ Agni is presented as a goat. He is Chāgavakra, goat-faced, as Naigameya Agni. ('Mahābhārata' Vanaparva, 228. 27).

⁴⁰ Amṛtabindu here means sweat.

Puruṣa and Agni are one, their middle term here is the sacrificial animal, the goat.

In the Vāstupuruṣamaṇḍala, the body which is laid out is that of Man. Not in every version of the descent of the nameless Asura is he known as goat-headed. When he is thus laid to rest, the sacrament of cremation, as it were, is performed for him as of a person who had died on a journey⁴¹.

The fallen Asura lies with his face down⁴², it must be thought of as buried in the soil and part of it. This is the destination which he has reached so that the buildings set up on him are firmly established. His Āsura power is held by the gods; it stays where he has come to rest.

The Puruṣa built into the Altar faces upwards (uttāna), towards heaven, towards light, his destination. The Asura, fallen, face downwards, carries and protects the building and receives his name: Vāstupuruṣa, the Puruṣa of the site. This is how he should be meditated upon at the rites of installation of a house of God and man. To the devotee who worships the Vāstupuruṣa a miracle happens. He beholds him in his true state, facing upwards, whence he had fallen. The Vāstupuruṣa thus lies in the same position as Agni Prajāpati reconstituted as the Vedic Altar. He carries the gods on his face and chest, they are stationed on his supine body (Br. S. LII. 51-54)⁴³. Somaśambhu says: "With folded hands the Asura lies, facing upwards, (uttāna) during the performance of pūjās⁴⁴; with his face bent down he should be meditated upon at the rites of installation, etc., of a house of God or men". ('Sāradātīlaka', III. 2, com. 9). United with the gods he is the firm basis for an ascent to the high region by means of the temple, built on his recumbent body. By looking (darśana) at the temple, which he carries, its builder and whosoever knows its meaning, is led to the highest point.

⁴¹ In that case a human figure is made of Palāśa sticks on the skin of a black goat; W. Caland, 'Die altindischen Todten und Bestattungsgebräuche', p. 88.

⁴² 'Bṛhat Saṃhitā', LII. 2-3; 'Matsya Purāṇa', CCLII; 'Īśāna-paddhati', III. ch. XXVI. 125; 'Kāśyapaśilpa', II. 13; 'Mānasāra' VII. 253 f. etc.

⁴³ "Uttāna" spread out, looking upwards, is the Vāstupuruṣa according to 'Viṣṇusaṃhitā', XII. 51; 'Agni Purāṇa', XCIII. 3; 'Vāstuvīdyā', IV. 48; 'Manuṣyālayacandrikā', II. 28; 'Sāradātīlaka', III. 2. comm. 3. The latter says "prottāna"; and adds, III. 2. Comm. 6: "elsewhere it is said that the face of the Vāstu is bent down."

cf. the golden Puruṣa. Ś.B. VII. 4. 1. 45; 'Kātyāyana', XVII. 4. 10.

⁴⁴ Of the Vāstupuruṣa, after his fall to earth, the texts say: The Vāstupuruṣa lies on the ground, placed there by the gods (Br. S. LII. 2-3; 'Matsya Purāṇa', CCLII); prostrate at the feet of Śiva; he remains in that position 'residing' on earth ('Īśāna-paddhati', Part III. ch. XXVI. 101-10, 117-9); he has been put down by the gods and placed on earth ('Sāradātīlaka', III. 2. comm. quoting Mahākapiñjala); he has been so placed to prevent his arising; ('Merutānta', quoted in 'Puraścaryāṇava', pp. 105-6). The Vāstupuruṣa sleeps, rises from his sleep, sleeps again ('Śaivabhūṣaṇam', p. 140; cf. Jyotiṣa Śāstra). It is impossible to kill the Vāstupuruṣa; he is put or puts himself into a pit, and the gods prevent him from coming out; 'Tantrarājatantra', ch. XXX. 4-11; 'Puraścaryāṇava', I. c. Such are the degrees of his recumbent state according to various texts. Prostrate and defeated, he is resurrected and transformed in the gods who reside in him; in them he survives his fall.

NATURE AND NAME OF THE VĀSTUPURUṢA

The head of the Vāstupuruṣa lies in the East⁴⁵; such is the ancient tradition conforming with the symbolism of Agni. "The head of the Vāstupuruṣa lies in the East, in the site of 64 squares" ('Samarāṅgaṇasūtradhāra', XIV. 11). But "the head of the Vāstupuruṣa should be placed in the North-East, in a site of 81 squares" (ib.)⁴⁶. "The north-eastern direction is invincible" (aparājita; 'Ait. Br.' I. 3. 14)⁴⁷. The site of 81 squares was specially assigned for worship by Kṣatriyas, and for their buildings. The sanctity of the north-easterly direction is that of work (karmamārga). That is their path of liberation.

The symbolism of the Vāstupuruṣamaṇḍala has its origin in and retains its connection with the Vedic altar and the rites of the sacerdotal part of the Veda, the Brāhmaṇas. It is adapted to the 'dharma', the rules of life of the Kṣatriyas. At the age when the Vāstusāstras known to-day were compiled and at the same period when the many existing temples of stone and brick were built the two types of the Vāstupuruṣamaṇḍala, the one for Brahmans, the other for Kṣatriyas co-exist and also commingle.

They were a residue of traditions still known and practised though no longer realized in all their import. On them, their 'tonic', the building of the temple rests; the disposition of the site-plan of the entire precinct is in consideration of the Vāstupuruṣamaṇḍala. The ground plan itself of the temple is laid out in its analogy and with all the indefinite variations of its theme. The ground floor (adhaśchanda) of the temple is planned with the Garbhagrha in the centre; this as a rule is square and corresponds to the Brahmasthāna. It is surrounded by thick walls on which rests the high superstructure; these conform with the border of squares occupied by the divinities who surround the Brahmasthāna. The buttresses and various kinds of projections of this wall are from the outer border of the square, the zone of the 32 Padadevatās; they form the perimeter of the temple. The rhythmic structure of the Vimāna proceeding from its centre

⁴⁵ 'Samarāṅgaṇasūtradhāra', XIV. 11; XLV. 18; 'Mayamata', VII. 49; 'Vāsturājavallabha', II. 18; 'Śilparatna', VII. 34; cf. 'Āpastamba Śrauta Sūtra', XVI. 28. 1. 2. "He should pile a human figure of bricks, from East to West, its head formed by the head of the golden Puruṣa."

⁴⁶ 'Brhat Samhitā', LII. 51; 'Īśāna-paddhati', III. ch. XXVI. 125; 'Vāsturājavallabha', II. 2; 'Manuṣyālayacandrikā', II. 28; 'Śilparatna', VII. 28½. The texts are not always explicit about the relation of the position of the head of the Vāstupuruṣa and the number of squares; the two varieties intermingle, the one of 64 squares and the head in the East, the other of 81 squares and the head in the north-east. A not always consistent terminology (vaṃśa; nāḍi, etc.) results; see p. 54.

Priesthood and kingship have their distinct versions of one and the same Puruṣa who underlies their building activities.

⁴⁷ The north-east is the direction facing which Prajāpati created creatures, and towards which the sacrificer offers oblations; it is the quarter of gods and men, and the gate of heaven. Ś.B. VI. 6. 2. 2-4.

towards its perimeter is laid out according to the proportions within the network of squares in the ground plan. (Part VII).

The ground plan of the temple, whatever may be its variations, is analogous to the Vāstupuruṣamaṇḍala and retains in its rhythmic order proceeding from the centre and in the modulations of its perimeter, the knowledge of the Vāstupuruṣa in all his parts. The rhythm (chandas) of the ground plan is derived from the order in the Vāstumaṇḍala. The relation of sacred architecture to the Vāstupuruṣamaṇḍala is reflected moreover in the sculptures on its walls; their iconography is essentially an iconometry (tālamāna). The distinctiveness of the sculptures rests upon their proportion and positions; their merit is in their form and results from a supererogation in the correct execution of the rules. It exceeds the rules by intensifying their *raison d'être*. To this excess of application is granted an immediate realisation, possible only where the knowledge is perfect. Its possession shows a freedom through which the grace of the Lord (anugraha) becomes impressed on the work. It is in the 'readiness' (pratyutpanna) which distinguishes the inspired craftsmen whose competence has become effortless. On the firm basis of iconometrical structure, itself correlated to and in continuation of the proportion of the temple, the many images have their place assigned to them as parts of the body of the building; their movements too and the relatedness of form in the single figures are similarly assigned.

Unknown in its intrinsic form and nameless the Asura had come to earth. Defined and named thenceforth he dwells on it. In his extension he holds duration and within duration time runs its course. Wherever his image is laid out, he fills the place to which it is applied, whether it is large or small, in its entire extent, like the ether which is even in a pot.⁴⁸ The symbol of its ordered extensiveness is the square so that it is even said of him: long ago there was a demon in the shape of a square (caturaśrākṛti).⁴⁹ This is his own, intrinsic form on earth; man or goat are but names and places of reference. The rule of the square, the final and perfect form is established as long as the earth itself survives and will dissolve along with the stars at the time of universal dissolution (pralaya).⁵⁰

In some accounts of his fall⁵¹, the Asura is described as having been dug into the earth by the gods, or else himself to have dug a pit and entered it of his own will. There he subsists, his substance commingling with the soil, the sacrificial victim self-offered, the prototype of all foundation sacrifices⁵² similar to 'man' the first of the sacrificial victims in the construction of the Vedic altar. No human sacrifice takes place during the established rites of Vāstu-śānti, Vāstu-homa, and

⁴⁸ 'Manuṣyālayacandrikā', II. 27-28.

⁴⁹ 'Tantrarāja-tantra', ch. XXX. 4 f.

⁵⁰ 'Śāradātilaka', III. 2. comm. quoting Mahākapiṇjala.

⁵¹ 'Tantrarājatantra'; 'Merutantra', quoted in 'Puraścaryārnava', I. c., etc.

⁵² Foundation sacrifices are offered in the belief that the condition of permanence of a great building depends on the sacrifice of a human being. W. Crooke, 'Religion and Folklore in Northern India', p. 109; also 'Indian Antiquary', vol. LVI, p. 135; and Abbot, 'The Keys to Power' p. 209. H. Shastri, 'The Ruins of Dhaboi' p. 2-3 tells of the architect Dabhane who was immersed for 6 years under the temple of Kālīkā-mātā which he had built. For further reference to sacrifice and burial below a building to be set up "so that by this act the pre-existing divinity of the place is reinforced" see P. Mus, op. cit. p. 674.

Vāstu-bali. It might have preceded them as it preceded the Vedic rites laid down in the Śatapatha Brāhmaṇa; essentially however, each sacrifice is an eternal 'puruṣa-medha'.⁵³

Vāstupuruṣa, if worshipped as an image (mūrti)⁵⁴ is a fearful looking male figure. He is as repulsive as Jumbaka, who is sacrificed by drowning, to Varuṇa⁵⁵; Jumbaka therefore becomes Varuṇa⁵⁶. Man, the sacrificial victim, figures here as an embodiment of the sacrifice of the lower self; the drowning of Jumbaka is alike to the sinking of the Bhūta to the ground and into the soil; this is the Asura's part down below the gods, yet simultaneously present with them, and their support.⁵⁷

As yet without name and form is the Asura at the beginning of his fall, for he has only then fallen from the state beyond name and form. In his descent he becomes a Bhūta, an existing thing, and acquires name and form (chāgāsura). Estranged from the Principle, Existence desires to exist alone; it suffers defeat and is assigned its place on earth, one with the Devas who brought about the ultimate fall; appeased and at one with itself and in its proper place, its name is Vāstupuruṣa. When, in one version of his story he sinks into the earth submerged in its darkness, his integrity is restored 'ab intra'; self-sacrificed he does not die, "for he (the Puruṣa) is Death himself in the splendour of the immortal" (Ś.B. X. 5. 2. 3) or Varuṇa.

When he sinks down dark, hideous, impotent, submerged, and inactive, he has reached the ground where his identity is lost. He lies wrapt in the darkness of his nature, the nature which pulled him down; now no longer distinct from it. He has reached the other pole, where existence ceases, reintegrated into the darkness of the deity 'ab intra'. There he lies submerged as Asura, at the same time converted into the gods, who have taken their stand on him and are his 'body' on earth.

⁵³ A. K. Coomaraswamy, 'Angel and Titan', op. cit. p. 401.

⁵⁴ 'Mahānirvāṇa Tantra', XIII. 63-66.

⁵⁵ Āp. Śr. S. XX. 22. 6.

⁵⁶ Vāstupuruṣa as a form of Varuṇa (Vṛtra), see 'Kāśyapaśilpa', II. 12-24, where he is beheld as Viṣṇunārāyaṇa and Mahājala (jalādhipa). "The recumbent is originally Varuṇa; supported on the back of the waters (AV. X. 7. 38), finally Nārāyaṇa Viṣṇu." Coomaraswamy, 'A New Approach to the Vedas', p. 61; Varuṇa (manifested deity) is sacrificed and re-surrected.

Johannsson, 'Die altindische Göttin Dhiṣaṇā', p. 128. Varuṇa is Asura and King, Lord over life and death, finally Nārāyaṇa-Viṣṇu. He is self sacrificed deity. This is exactly how, following the 'Merutantra', the Vāstupuruṣa-Asura-Prajāpati is shown as a righteous and wise king, who in order to keep his word, destroys his body ('Puraścaryārṇava', op. cit., pp. 105-6).

⁵⁷ The 'Skandapurāṇa', Nāgarakhaṇḍa, CXXXII. 7 speaks of the Bhūta as arisen from the earth. Here, indeed, has the divinity of the soil come to commingle with the Bhūta "born from the sūkta of Atharvan and the drop of nectar" (śl. 15, ib.). He had been made invincible by the rhythmical magic formula (mantra) of Śukra.

The story is here adjusted to a particular Tīrtha, called Vāstupada and installed by Kātyāyana, the Brāhmaṇa. The potency of this Tīrtha is represented in its being the place of the arising of the Bhūta (it had been sent there by Muṇḍa, śl. 15). Born from the Sūkta of Atharvan it is sent to do its work at this particular spot. Battle, defeat, etc., are then described and the Bhūta is finally laid to rest. Hari (Viṣṇu) asks Brahmā to name the Bhūta.—This is a Vaiṣṇava version referring to a special Tīrtha, of the Vāstupuruṣa story which is told in Vāstusāstras and Śaivāgamas (I.P., III. ch. XXVI. 93, f. quoting Brahmaśambhu).

In the microcosm, in man (jīva), Existence, the demon, correspondingly is known by the name of Pāpapurūṣa (the Purūṣa of Evil, the Evil person). He is thought of as an ugly black man, angry, with red beard and red eyes, holding a sword and shield, with his head always held low ('Mahānirvāṇa Tantra', V. 99) residing in the left cavity of one's abdomen. Thus he is known to be after the Sādhaka has dissolved and integrated all the forms of existence (tattva) one after the other, the lower always in the higher and finally in the origin whence they have arisen and his self has become free of them.⁵⁸

Existence, un-principled, fallen from the Principle, unknown to itself in its form, unnamed, this calamitous Asura at last allows himself to be caught in form and name. In the story told in the 'Īśānaśivagurudevapaddhati', it has come to earth as goat-headed Asura and lying prostrate at Śiva's feet, it begs of him the boon which Śiva grants him, existence and residence (vāstu) on earth; so his name henceforward is Vāstupa, protector of site and building (vāstu). Derived from the radical "vas" which means to "exist" and to "reside", the Asura will reside on earth (vasundharā)⁵⁹ and Brahmā and the other gods will reside in him.⁶⁰

Vāstu, whose body is Vastu, existence⁶¹, Vāstupa, protector of Vāstu, Vāstoṣpati (I.P. III. ch. XXVI), lord of Vāstu, and Vāstupuruṣa (Br. S. LII. 2) are variations of the name given to Existence made secure, steady⁶² and laid out in order⁶³. Vāstoṣpati is an ancient divinity. Rudra Prajāpati married the Dawn and begot four sons. The fourth is called Vāstoṣpati or Gr̥hapati—Agni.⁶⁴ "When the father embraced his daughter (sky or the dawn), then he came also in contact with the earth and poured his seed there; then the gods reflected and fashioned out of it Brahmā called Vāstoṣpati, the protector of sacrificial rites and the Lord of the site at the sacrifice" ('yajñiavāstusvāmī'; Sāyana on RV. X. 61. 7). In 'Manu Smṛti', the later Śaiva tradition and in Vāstusāstra, the Asuratva, the Asura nature of Vāstoṣpati is all there, and while he is the lord of the Vāstu, he

⁵⁸ 'Mahānirvāṇa Tantra', XIII, 42-46 describes the Vāstupuruṣa and his (12) followers. Some of their names are: Bhiṣaṇa (ferocious), Raktalocana (red eyed), Koṭārākṣa (with deep sunk eyes); Vāstu-pati himself should be meditated upon as of ferocious aspect, with big belly, long ears, hairy body. His followers carry sword and shield.

⁵⁹ Vasundharā, the holding or carrying substance, or wealth (vasu), is a name of the earth; 'vasu', 'vastu' and 'vāstu' are from the radical 'vas', to exist, reside; vasu: substance, thing, wealth; vastu: existence, substance; vāstu: residence dwelling, site, house. See notes 65, 72.

⁶⁰ 'Skandapurāṇa', Nāgarakhaṇḍa, CXXXII. 29-30, after relating that the place finally remained quiet, makes Hari ask Brahmā, to name the Bhūta: "since he reacted to the word and you also addressed him "Vāstu" (Vā-astu) "be auspicious" (exist as residence, be a dwelling) let his name be Vāstu."

⁶¹ I.P., III. ch. XXVI, 93 f.

⁶² 'Āśv. Gr̥. Sūtra', II. 8. 15 and 'Pāraskara Gr̥ S.', III. 4. 3. invoke Vāstoṣpati, the "steady one". See Part I.

⁶³ Also Vāstudeva ('Matsyapurāṇa') or its opposite: Vāsturākṣasa; his followers are Vāstu daityas ('Mahānirvāṇa Tantra', XIII. 42; 59-66). The Vāstupuruṣa is and remains an Asura and therefore both the roles of Deva and Daitya are his by nature. He is and remains Vāstu-brahmā, created first by Virāj ('Vāstuvīdhāna', op. cit., VIII. 14); or else by Brahmā by whom the worlds were created only afterwards ('Samarāṅganāsūtradhāra', II. 4). cf. Coomaraswamy, 'Angel and Titan', I.c., p. 374: "The designations Asura and Deva may be applied to one and the same 'Person' according to the mode of operation."

⁶⁴ R. Shamasastri, 'Vedic Iconography', JISOA, vol. X. p. 80.

lies with his face down, the fallen Asura. His overlord (vāstvadhipati) is Brahmā (Ī.P., III. ch. XII. 22). The duplication of Brahmā-Vāstospati, his two-fold nature as god and Asura is a record of his fall from the Principle into manifestation with its dichotomy. While the Asura figuratively remains the larger, all filling, spread everywhere, in his inmost part, in the middle, in his heart there is Brahmā. "In the centre of the building let him place an offering (bali) for Brahmā and Vāstospati conjointly" ('Manu Smṛti', III. 89).

In his benign aspect, Vāstospati is the protector of the home ('Nirukta', X. 16)⁶⁵. He assumes all shapes⁶⁶; he is Rudra⁶⁷; such is his Asura-power, spread out on earth, where his realm coincides with that of Agni with whom he is identical in essence.

Agni's sphere is the earth⁶⁸. He is the giver and protector of dwellings (gr̥hapati, vāsaka, etc.)⁶⁹ the radiant (vasu) among the gods⁷⁰. The Vasus, the sparkling ones, are the eight gods causing the mortals to abide (vas); the terrestrial region is their sphere of action (Ś.B. VI. 1. 2. 6). Agni and also Indra⁷¹, Prajāpati, Soma and other gods are invoked as givers of dwellings, all the Vasus⁷², all these divinities have their station in the Vāstumāṇḍala. Under whatever name the Vāstupuruṣa is known, his form on earth is square. This form is his, as far as he is Yama, Death, the Dharmarāja whose city is square. Its squareness was made use of by Viśvakarmā, the archetypal architect, as the shape of the first ornament he gave to manifestation.

Vāstospati is the lord of the building and the Earth is the mistress of the house⁷³. She is the soil; on her he leaves his impress and she receives his seed. This is the meaning enacted in the rites of sowing the seeds, etc. (añkurārpaṇa) and of depositing the germ (garbhādhāna). From the inception to the completion of the building, the indwelling divinity is worshipped by the rites of architecture. "The wise man, who has taken a vow to consecrate a building, should perform the rites, beginning with the worship of Vāstu and ending with that of the Vasus".

⁶⁵ "Vāstospati (Lord of the vāstu)—Vāstu is derived from the radical 'vas' meaning to 'dwell'—is the lord or protector of the house."

'Bṛhad Devatā', II. 44 (Macdonell, p. 42). "But because being in the middle (sphere) he granting an abode (vāstu) to the world, protects it, therefore the son of Ūrvaśī (Vasiṣṭha) proclaims him to be Vāstospati".

Vāstospati as protector of the house: RV. VII. 54. 1; 55. 1; AV. VI. 73. 3; 'Taitt. Samh.' III. 4. 10. 1; Āp. Ś. S. VI. 28. 8; Pār. Gr. S. III. 4. 7; Hiraṇyakeśin (SBE. XXX) I. 8. 28.

('Mahānirvāṇatantra', XIII. 178-179). The temple is dedicated as the residence (vāsāya) of divinity (ib. 245)⁷⁴.

Unknown in its own form, its name as yet not defined prior to resting there, Existence has come to earth; fallen from the Principle, swelled with pride, it had become all filling; unprincipled as it is, it creates disorder and defeats its aim; accepts defeat on coming to earth, its valour proved and spent, it sinks down and receives name and definition. Sunk to the bottom, it reclines there, rests and sleeps securely in its reintegrated identity; lost to the world, sunk to the ground, absorbed and one with it; and from then onward at the same time, for all time, till the dissolution of the very ground on which it rests it is one with the gods who have defeated the un-principled Bhūta Existence and settled on it, so that while it carries them, they carry it on, each in its proper place and time. Existence, rid of itself, of its assertiveness (ahaṁkāra, the principle of individuation, which grows into the all-filling, destructive Āsura-bhāva) becomes the support and covers the extent of the Vāstu, an image of ordered manifestation. Vāstu now is its name. Its image is that of the Puruṣa, the place of reference in which man beholds the identity of macrocosm and microcosm. On its appeased being and form spread out on the ground he sets up the temple, the monument of his own transformation. Its superstructure points to the origin of the primeval descent; it is undone by the ascent step by step, shape by shape, along the body of the temple. This body once more, in the concrete form (mūrti), made by art, is that of the Puruṣa, arisen.

⁷⁴ In the final rite of Vāstuhoma, the Ācārya circumambulates the fire in honour of Vāsudeva. 'Kāśyapaśilpa', III. 17.

THE GODS AS CONSTITUENTS OF THE 'BODY' OF THE VĀSTUPURUṢA

The Vāstupuruṣa, once laid on the ground, is measured out in squares, from east to west, with the course of the sun, from light to darkness. He is one and omniform; all the possibilities of existence are displayed in the tranquillity of his recumbent state. Each is divine by nature, an essence established at its proper place and has the name of a god. Their sum total is the Asura; their multiplicity is held by their place of reference which is the Vāstupuruṣa, resurrected and transformed. He is the deity 'ab intra', the Asura with his face down, sunk into the ground, and one with it; and resurrected, facing upward with all his powers laid open in their proper place, his hands joined in 'aṅjalimudrā',⁷⁵ in eviternal worship of the Supreme and undivided principle where lies his origin and which he now reflects, its 'image' on the earth. Space and time are its measure and form its body. It is square, similarly, each power or divinity is laid out in squares (pada); their total is the Vāstupuruṣamaṇḍala, of 64 or 81 squares, according to its fitness for Brāhmaṇas and Kṣatriyas. Forty-five Devatās occupy the body of the Vāstupuruṣa; they cover his extent, they are his limbs and vital parts and their sum total is the Vāstupuruṣa with whom it is co-extensive. Their number necessarily is the same in the Vāstupuruṣamaṇḍala of 64 or 81 or any of the other numbers of squares; only the extent allotted to each, differs, but not their relative position in the plan.⁷⁶ This allows certain variations also within each of the two leading types. Some of these, found in several texts, are shown on pp. 86-88.⁷⁷

The centre is the place of Brahmā and 44 Devatās are grouped around it. The Brahmasthāna, the nucleus of the maṇḍala, invariably extends over four squares in the Maṇḍūka and over nine squares in the Paramaśāyika plan. It is the root of each Vāstu while the other Devatās hold the ground around it and face it in

⁷⁵ In Śaiva tradition, Vāstoṣpati is Īśāna ('Paurāṇikavāstuśāntiprayoga', fol. 24) sunk into the ground, he is Vāstudeva who dwells at Pātāla (the nether worlds), the upholder of the earth (fol. 25). The Vāstu-deva is the Vāstu-nāga, the support of all architecture ('Nāgara'; see Part VII); he is worshipped as a golden serpent. His double nature, one with the Godhead, unmanifest, is ophidian; manifest he is the God of gods, Īśāna, Siva, whose image is the bull (vṛṣa). The 'Vāstumuktāvalī', pp. 146-47, therefore prescribes the installation of the golden serpent; and north of it the Vṛṣa-Vāstu, made of gold, (also: 'Vāstu-śāntiprayoga', fol. 10).

The golden images of bull and serpent represent the twofold nature of the golden image of the Puruṣa. (Re. the bull and the serpent, cf. the Greek god Zeus). As an 'anthropomorphic' image, the Vāstupuruṣa shines like gold, has 4 faces and 4 hands, holds rosary and water vessel, is Vāstubrahmā (cf. the 'dhyāna' of Brahmā, 'Mānasāra', VII. 155-162); in his 'rājasika' aspect he is beheld as ferocious, holding a mace, trident, axe and skull-staff; he is red as the rising sun, and like the god of death to his enemies ('Mahānirvāṇatantra', XIII, 63-66). Other images of the Vāstupuruṣa (for inst. 'Prayoga-Pārijāta', pp. 94-96, śl. 35) are two armed.

⁷⁶ Full squares are meted out in the maṇḍala of 81 squares to each Devatā, whereas in the plan of 64 squares, half squares or isosceles right angled triangles accommodate the entities placed at the corners, along the diagonals, from the corners of the maṇḍala, to the corners of the Brahmasthāna in the centre.

⁷⁷ The names of the divinities are given in the Paramaśāyin plan on p. 32; see also Part II, note 30. Paramaśāyin, the 'Supreme Recumbent', denotes the deity 'ab intra'.

two borders, of which the sum is three squares or units wide. Surrounding the immutable centre, the rule applicable to the triple rows around it is that 12 Devatās form its inner rim, the border of the Brahmasthāna, and 32 Devatās are stationed along the perimeter of the Vāstumaṇḍala and form its outer rim. The whole of the outermost row is invariably occupied by the 32 Devatās, who are therefore called Prākāra Devatās or Pada Devatās; enclosing the Vāstumaṇḍala, or occupying all the squares along its outline. $1 + 12 + 32$ entities are thus stationed in the centre and around it. Their number and position give their meaning and form the body of the Vāstupuruṣa (Figs. 1-7).

The plots which are assigned to the various divinities are not of equal size, in the various plans. 45 entities are accommodated variously in 64 or 81 units. The immutable relation is the proportion between the centre, the Brahmasthāna, and the total square. Fixed also is the number of the 32 marginal gods. It allows one square to each of the marginal gods in the plan of 81 units, whereas a division by the main diagonals, of the squares situated in the corners meets the contingency of distributing 32 in 28, by halving the squares along the diagonals, in the corners.

The number of squares assigned to the various divinities varies in the different plans. It makes the demarcation between the two borders a shifting one, now

TYPES OF THE VĀSTUPURUṢAMAṆḌALA⁷³

Vāstuvidyā, IV. 36.
Mānasāra, VII. 83-110.

(5) PARAMAŚĀYIN : A
Viśvakarmaprakāśa, V. 54-65.
Brhat Saṃhitā, LII. 42-54.
Matsyapurāṇa, CCLIII. 25-35.
Īśānaśivagurudevapaddhati, III.
ch. XXVII. 35.
Mānasollāsa, II. ch. III. 1. 73-87.
Viśvakarmavidyāprakāśa, I. 66-70.
Paurāṇikavāstuśāntiprayoga.

(6) PARAMAŚĀYIN : B
Samarāṅgaṇasūtradhāra, XI. 1-14.
Tantrasamuccaya, I. 1. 60-67.

The sources for the drawing of each mandala are noted against it.
The black field is the Brahmasthan. Closely set parallel lines show the plots of 4 of the inner divinities whereas the broken oblique lines mark the 8 plots assigned to the eight

adevatās⁷⁹ encroach upon the inner border (Figs. 2, 6). The simplest solution shown in the Paramaśāyika plan (Fig. 7) and similarly, in the Maṇḍūka plan (Fig. 3); its opposite, though analogous application is in the Maṇḍūka plan (Fig. 1). The other plans are more intricate.

The total width of both the borders is three units, in either of the two plans. The variations affect the inner border of two units width and introduce, proceeding from the centre, in the main directions the following rhythms in the plan of squares :

1:1:2; 1:2:1, and in that of 81 squares : $1\frac{1}{2}$: 1 : 2; $1\frac{1}{2}$: 2 : 1; whereas an arrangement of rhythms takes place and an addition of further ones towards the periphery, in plans like Figs. 2, 5. The Brahmasthāna is wreathed by different symmetrical movements. They clasp its square and leave it unaffected.

Prayogapārijāta, Vāstuhomavidhi,

3-14.

Brahmā in the centre is one; he occupies the position from the heart to the top of the Vāstupuruṣa; the Brahmasthāna in the Vāstu is the vital centre, in the middle of which are the Mahāmarmas; it is the equivalent to the Brahmapura, the microcosm. ('Chānd. Up.' VIII. 1. 1.)⁸¹ The place of realisation of

her "inner divinities". The areas occupied by the 32 outer divinities, the Padadevatās, are left blank.

The 'Śāradātilaka', III. 8. comm. gives the meaning of Maṇḍūka, the Yogapīṭha; its description however is not given in detail, Maṇḍūka B or C would answer it.

The same names are given of the East-West and of the South-North lines (śīrā=śīrā) in the 'Śvakarmaprakāśa', V. 22 f. and the Br. S. Comm.; cf. p. 54.

⁷⁹ The divinities who are meant to occupy one Pada (square) only of the outer border.

⁸⁰ A further variety of the Paramaśāyika plan is prescribed in the 'Tantrarāja-Tantra', CX. 11-14. The 4 main inner divinities occupy 3 squares each, and the remaining 8 inner divinities, 2 squares each.

The 'Mahānirvāṇatantra', XIII, 49, prescribes as maṇḍala for the worship of the Vāstupuruṣa, a square of one cubit side length, with a lotus in the 4 central squares and the 12 flowers of the Vāstudaitya around it. This square of 16 units is similar to a Rāśicakra.

⁸¹ The images here are similar though not identical; cf. the lotus in the 'city of Brahman'.

The lotus, symbol of manifestation, is also drawn in the centre of the Vāstumāṇḍala

the Supreme Brahman, the centre of the Vāstupuruṣa, is assigned to Brahmā who is the effected (kārya) Brahman; this is the subtle state of manifestation which in ontological hierarchy is prior to manifestation. The place of Brahman (Brahmāsthāna) corresponding to Brahmapura in the universe is the Hiranyagarbha, the Embryo of Splendour, the primordial germ of cosmic light⁸². Similarly, from the Brahmāsthāna proceeds the light of all times and in every direction; this makes the first belt, the inner border of 12 entities. In the outer rim of 32 entities it is marked at each place at its definite time and encompasses the extent of corporeal manifestation.

The centre, the place of the unconditioned Brahman, is represented by Brahmā, the Regent of that place. Radiating from the centre is its effulgence, the light of all suns that ever shone and which in repeated cycles illuminate this universe. This light of all suns is carried by the Regents of 12 Suns, the Ādityas. Their names are given. In name, it will be seen, they reduce themselves to 8, their Vedic number; four of them, in the corners, appearing in 'pairs'⁸³. The other four occupy one full side each of the Brahmāsthāna, or surround it altogether. The light is carried across this inner border and to the outer rim with its four orients in the middle of each side. In the centre is the dark source of all light, the superluminous darkness, the central point beyond all time, located in the square (2² or 3²) of the Brahmāsthāna; it radiates from there and its radiance proceeds through all the stations of the Regents of sun and stars, placed on the body of the Vāstupuruṣa which is the square Vāstumāṇḍala. From the centre beyond time, and around it, is displayed cyclical time in its sections, in its units of days, months and years and in the cycles in which the different courses of sun and moon are adjusted. Laid out around the Brahmāsthāna, collateral with the centre, all these times are simultaneous, in one duration, supernal time. But in the outer border, proceeding to the right (pradakṣiṇa) the succession of time is parcelled out in the stations of the Regents of the Nakṣatras, etc.; their houses are in the squares of the outer rim.

Of the 12 inner divinities, Aryaman, Vivasvān, Mitra and Mahidhara are assigned large plots, on the four sides of the Brahmāsthāna, beginning from the East⁸⁴; whereas pairs of divinities, Savitṛ and Sāvitra, Indra and Indrajaya, Rudra and Rudrajaya⁸⁵, Āpa and Āpavatsa reside at the corner squares, or their halves

('Mahānirvāṇatantra', XIII. 54); Brahmā issues on a lotus from the navel of the Puruṣa. This is the place of 'Brahmāpātmasambhava' ('Tantra-Samuccaya', I. 1. 62). The Brahmāsthāna lies between the heart and the belly of the Vāstupuruṣa, this is the 'daśāṅgula' (Śaṅkarācārya on 'Svetāśvataropaniṣad', III.) from the navel, the seat of 'manas' (mind), to the heart, the seat of 'buddhi' (intellect) in man, the microcosm.

⁸² In relation to Brahman, the Supreme Principle, the diagram of the Vāstupuruṣa as ontological symbol, is equivalent to Virāj, the central squares corresponding to the Hiranyagarbha.

⁸³ Proceeding to the right, with the sun, the sequence of the orients is from East to South, etc. See also note 86.

⁸⁴ The 'Īśānaśivagurudevapaddhati', I. c., puts Marīci in place of Aryaman. Marīci is Light, Ray of Light, Radiation, cause of all activity. Marīci is a mind-born son of Brahmā, his son is Kāśyapa, whose son is Mārtāṇḍa.

⁸⁵ The 'Bṛhatsaṃhitā' places Rājanyakṣman for Rudrajaya; similarly the 'Garuḍapurāṇa', I. XLVI. 9-11. see Part II. note 30.

from the south-east corner onward. The four corner divinities, but for those in the north-west are procreatively related and conduct from the inner to the outer rim the light which comes from the centre⁸⁶.

Aryaman is yonder sun ('Taitt. Samh.', II. 3. 4. 1); Vivasvān is Mārtāṇḍa, the mortal form of Brahman, whom "Aditi bore hitherward into repeated birth and death" (RV. X. 72. 9), Mitra, the Sun, is an Āditya⁸⁷ and Mahīdhara or Pṛthividhara, "the upholder of the earth", is Ananta ('Samarāṅgaṇas.', XIV. 11-31) who is Viṣṇu⁸⁸, the Sun, and all it brings to light. Viṣṇu as Ananta, the Serpent, supports the universe on his head ('Viṣṇupurāṇa', II. V); from below he upholds the earth, the level from which the temple rises. It is here then that the Vāstupuruṣa, the existential Puruṣa, has his identity most fully established by the likeness of the Yajña-puruṣa, who is Viṣṇu (yajñamūrti; Ś.B. I. 2. 5. 1-6). Vāstu is also Dhara, the upholder of the earth, and in this function he is one of the 8 Vasus ('Bhāgavatapurāṇa') who cause the world to abide (vas), so that in Mahīdhara, north of the Brahmassthāna, the Vāstupuruṣa is most firmly fixed in his nature⁸⁹. It is here that he is most firmly set and presided over by Viṣṇu who, according to Tantra, is the Regent of the 'below' just as Brahmā whose place is in the centre is the Regent of the 'above'⁹⁰. In the Vāstu, the diagram of the hierarchy of manifestation and of its ordered existence, the vertical direction is symbolised in the centre, where the 'above' is projected from Mahīdhara to Brahmā. Along this vertical axis, Śiva stood when the goat-Asura fell down at his feet.

The sun in the intermediate directions carries the light from the centre to the corners. Savitrī stationed in the south-east, is the sun (Ś.B. VI. 3. 1. 19),

⁸⁶ The couples of Ādityas here are not to be taken as being born in pairs. The second name of each pair has no place among the Ādityas, nor independence. It is a hypostasis of its leading name. This is made clear by the identifications of the names of the Devatās, in the 'Samarāṅgaṇasūtradhāra', XIV. 11-31. The Vedic number of the Ādityas is 7 or 8 (RV. X. 72. 8). Two and two sons were born of Aditi; in addition to the 8 sons of Aditi, the Rudras, Vasus, Maruts, etc., are also designated as Ādityas. In the Ś.B. XI. 6. 3. 8; 'Br. Ār. Up.', IV. 9. 5, and in general later acceptance the number of the Ādityas is 12. They are known generally as presiding over the 12 months of the year; Dr. Shamasastri, 'The Ādityas', 'Indian Antiquary', Vol. XLI. p. 290, and in 'The World Cycle', JISOA, vol. XI. p. 117, considers them as lords of the intercalary months in a cycle of eclipses.

⁸⁷ The two Ādityas, Mitra and Varuṇa, are located in the Vāstu close to each other. As Mitra means life which the sun gives, so is Varuṇa here its dark side, with its potentialities of decay and disease.

⁸⁸ 'Īśānaśivagurudevapaddhati', III. ch. V. 9.

⁸⁹ In a peripheral sense, Ananta or Śeṣa, is the Vāstunāga, the "serpent of the site", who moves around every building site. In this concept, the movement of the Vāstunāga is associated with that of the Vāstupuruṣa, as Caravāstu or movable Vāstu; underlying buildings, etc., which are used for temporary purposes, such as serve in the performance of a definite rite, or for the houses of men. For such purposes, time as movement encompasses the extent of the Vāstupuruṣa and makes him revolve along with it. ('Vāstuvīdyā', VII. 2-6; and 'Bhubana-pradīpa', IV-XII, transl. by N. K. Basu, in 'Canons of Orissan Architecture'). In the latter work it is enjoined that the body of the snake being divided into 8 (or 9) equal parts, head, heart, stomach, navel, knee, chin, ankle and tail, the foundation stone should be placed at the heart or stomach; the door also is to be placed at the heart or stomach of the serpent.

⁹⁰ I. P. Part III. ch. XXVII, 71 f.

the Impeller. Sāvitra—"inasmuch as Savitr saw them they are called Sāvitra" (Ś.B. VI. 3. 1. 1)—is the body of libation-mantras, or the mother of the Vedas, according to the 'Samarāṅgaṇasūtradhāra'. In this text, Savitr is equated with Gaṅgā. Gaṅgā is the celestial current (pravāha) of all the Śaktis, and from this sum total of all Power the 8 Vasus originated ('Mahānirvāṇa-Tantra', XIII. 154). In the 'Rāmāyaṇa' 7. 27. 34, Savitr is the eighth Vasu.

Filiation, or hypostasis of the female principle, associates Āpa, the Āditya of the north-east, with Āpavatsa. Āpa, in the 'Samarāṅgaṇasūtradhāra' is identified with the Himālaya and Āpavatsa with his daughter Umā. Indra figures as Āditya of the south-west. Indra is also the Lokapāla of the East; placed in the outer border he is there generally called Mahendra, the great Indra; this name however is given to him also as Āditya ('Vāsturājavallabha'). Rudra and Rājanyakṣman hold the position of Ādityas in the north-west.

The Padadevatās, the divinities stationed all round the perimeter (viṣkambha; 'Silparatna', VI. 36)⁹¹, are regents of the Nakṣatras and are led by the warders of the four regions of space, the Lokapālas⁹²: Mahendra in the east, Yama in the south, Varuṇa in the west and Soma in the north (Sāyaṇa on AV. I. 31. 1). They are stationed in the middle of each side whereas the corners are occupied by the regents of the intermediate directions⁹³. The Aṣṭadikpālas, the Warders of the 8 regions are according to the 'Amarakoṣa', etc., beginning from the east: Indra, Agni, Yama, Nirṛti, Varuṇa, Marut, Kuvera and Īśāna. In the Vāstu, Kuvera figures under Soma's name as Lokapāla of the North⁹⁴. Īśāna however does not appear in all the treatises as the regent of the north-east. Agni holds this position in most of the earlier texts⁹⁵.

The East is the quarter of the gods and they are led by Agni⁹⁶ (Ś.B. III. 1. 1. 7; 'Tait Samh.' I. 8. 7. 1) and are "Agni eyed" (Ś.B. V. 2. 4. 6).

⁹¹ Viṣkambha is used here in its two-fold sense, as the central mass of light and the perimeter of the square place.

⁹² The Lokapālas are called Vāstudevatās by the Jainas.

⁹³ Ādityas and Lokapālas, Vasus, Rudras and Maruts have all sent their representatives to settle in the Vāstu. Their specific function there, as Āditya and Lokapāla, etc., is shown by their position. Ādityas moreover are also regents of stars (nakṣatra), the houses of the moon; the star of Aryaman is Pūrva Phālgunī and that of Mitra, Anurādhā. Mitra at the same time presides over the winter solstice.—The names of the Ādityas are variously given in the later texts.

⁹⁴ This is according to the list of identifications in the 'Samarāṅgaṇasūtradhāra', where the necessary substitution of Soma is made in the adjacent field, for Bhallāṭa, the holder of the crescent, Śiva.—'Manu Samhitā', V. 96, enumerates both, Kuvera and Soma. In Vastu-Śāstra, Soma, Kuvera and Bhallāṭa-Soma, are neighbours in the middle of the northern side; they are adjacent aspects of one entity. Bhallāṭa-Śiva corresponds to Īśāna-Śiva in the north-east corner.

⁹⁵ Īśāna is not included in the enumeration of Lokapālas in the 'Manu-Smṛti': Indra, Agni, Yama, Sūrya, Varuṇa, Vāyu, Kuvera, Soma.

Vāstu-śāstra adds Īśāna-Śiva in the north-east and assigns the middle of the north to Soma-Kuvera and to Bhallāṭa-Soma Śiva. Īśāna is one of Agni's nine forms. Vahni (Agni) is Hara (Śiva) according to 'Samarāṅgaṇasūtradhāra', l. c.

⁹⁶ Agni (Sikhin) is the regent of the north-east according to Bṛhat Samhitā, LII. 43; 'Matsyapurāṇa', 'Kāmikāgama', 'Samarāṅgaṇasūtradhāra', 'Tantrasamuccaya', 'Viśvakarma-vidyāprakāśa', etc.

Where Īśāna is stationed in the north-east, Agni is stationed in the south-east. The one or the other corner of the east, is assigned to him in the Vāstu, but the cardinal point is held by Mahendra and by Āditya (Sūrya). Īśāna is a form and name of Agni (Ś.B. VI. 1. 3. 17), Īśāna is the sun with its rays. Therefore Īśāna is lord of all the quarters (AV. XV. 1. 5), and is stationed particularly in the north-east, the most auspicious of the intermediate regions. Īśāna is an Āditya as is Parjanya, adjacent to him in the east, Jayanta and Mahendra, the Lokapāla of the east, and next to him Āditya, who is Sūrya, the Sungod, Lord of Planets.⁹⁷ They constitute the potency of Agni as the Celestial Fire in the quarter of the gods; it radiates forth in the names and the presence of many suns.

The remaining divinities in the east are some of the 'sparkling gods', the Vasus; they are the activity of the light on earth; they cause the world to abide; others are the forms, under which it abides; cosmic order and Righteousness, Dharma, and Desire, Kāma. The functioning of celestial light (Āditya) and its activity on earth (Vasu) coincide in some of the Padadevatās. Indra, the Āditya, is chief of the Vasus, he is the Vasu of the gods (Ś.B. I. 6. 4. 2); and is the Kṣatra (Ś.B. V. 1. 1. 11), the Regnum on earth. Āditya, Lord of Planets, is necessarily also one of the 8 Vasus (Ś.B. XI. 6. 3. 6). Satya, who is stationed next to him, is Dharma ('Samarāṅgaṇasūtradhāra', XIV. 1. c.) the Order of things; his son is Kāma, Desire, likened to the burning flame of fire (Kāma is Agni; A.V. VI. 36. 3), placed under the name of Bhṛśa (S.S. XIV. 16-17) to the right of Dharma. Antarikṣa, the mid-region, one more of the 8 Vasus (Ś.B. XI. 6. 3. 6), occupies the next position.

The south-east corner is held by Agni where Īśāna occupies the north-east. Where Agni is stationed in the north-east, the south-east corner is the place of Vāyu; Agni and Vāyu are interchanged, each of them being a Vasu: Agni (Anala) moreover is the son of Vāyu (Anila). Movement (Vāyu from 'va', to go, to move) gives birth to fire, the terrestrial fire, Agni as Vasu, and it is in this capacity, as world protector, that Agni is assigned to the south-east (Mbh. Ādi. 67. 18-25)⁹⁸.

The South is the region of the ancestors. The door to their world is in the south-east (Ś.B. III. 1. 1. 7; III. 6. 4. 12, etc.). The gods in the south are led by Yama ('Taitt. Samh.' I. 8. 7).⁹⁹ Yama, the Lokapāla, the fatal aspect of Agni (Ś.B. VII. 2. 1. 10), is Death, the son of Vivasvān Mārtāṇḍa. His filiation is shown in the Vāstu; he is placed by the side of Vivasvān. He is flanked by divinities associated with the Ancestors (pitṛ) and by divinities of evil portent.

Īśa (Īśāna) is the regent of the N.E. according to 'Viṣṇudharmottara', II. ch. XXIX, v. 20-23; the 'Viṣṇudharmottara' gives the list of the Pada-Devatās twice; the second time, v. 24, they are referred to as Stars.

⁹⁷ Parjanya is also one of the nine forms of Agni (Ś.B. VI. 1. 3. 15). He is the youngest of the Ādityas ('Harivaṃśa'). Jayanta, according to the 'Samarāṅgaṇasūtradhāra', 1. c., is Kāśyapa, father of the Ādityas.

⁹⁸ The Vasus are: Fire, Earth, Wind, Air, Sun, Heaven, Moon, Stars (Ś.B. XI. 6. 3. 6) and under corresponding names in the 'Mahābhārata, Purāṇas' and 'Amarakoṣa': Agni, Anala, Dhara, Vāstu, Āpa, Anila, Prāṇa, Pravāsa, Vibhāvasu, Arka, Savitṛ, Viṣṇu, Doṣa, Pratyūṣa, Soma, Droṇa, Dhruva.

⁹⁹ Ś.B. VIII. 6. 1. 17. connects the south with Vāyu. Here as elsewhere, the cosmology of the Vāstu is a condensed 'residue' from the several descriptions.

Nearest to the south-east corner, is Pūṣan, the Asura (RV. V. 51. 11) and Āditya (RV. I. 42. 1); he is the lord and guardian of roads (RV. VI. 49. 8), the shepherd of the universe who never loses an animal (AV. XVIII. 2. 54) and who gives prosperity (Ś.B. III. 1. 4. 19). So Death is introduced by Pūṣan, the Psychopompos.

At the end of the southern quarter, in the south-west reside the Pitṛs, the Fathers ('Br. Samh.', etc.) or Nirṛti, who is destruction, decomposition, the exit from life (AV. I. 31. 2; XIV. 2. 19; Ś.B. V. 2. 3. 3). Between Pūṣan and Nirṛti, Yama is flanked by Vitathā who is Adharma, the negation of Dharma, necessary as its opposite, an attendant therefore of the Sun who shines on good and evil. Nirṛti's husband is Adharma; her son is Bhṛṅgarāja. Gṛhākṣata who is Budha (Mercury), and Gandharva who is Nārada¹⁰⁰, messenger between gods and men, and who promotes discord between them, are the lesser gods in the south, the region of the Fathers and of Death. Mṛga (Capricornus), the solstitial door of winter corresponds to the north in the year, but to the south with regard to the course of the sun in the sky¹⁰¹; Mṛga here has the aspect of Ananta, the Serpent; adjacent to Nirṛti in the south-west corner, he points, 'pradakṣiṇā', towards the west, the quarter of Serpents (Ś.B. III. 1. 1. 7). The ophidian character, in the west, of the deity 'ab intra' is cast off in the region of Soma, the sphere of formation until the station of Īśāna is reached in the north-east.

Varuṇa, the son of Aditi (RV. X. 72. 8), is the protector of the West. When contrasted with Mitra, the non-proceeding Varuṇa is the power of darkness¹⁰². He is identical to the dread form of Agni. This Agni becomes Varuṇa in the evening; in the morning, rising he becomes Mitra (A.V. XIII. 3. 13). In the Vāstu, Varuṇa rules in the West, over the outer border, whereas Mitra's place is next to the centre, contiguous with the Brahmasthāna. The road leads, in the outer rim, along the dark west, to the north, the quarter over which rules the Moon, which is the quarter of men (Ś.B. III. 1. 1. 7; III. 6. 4. 12).

Among the acolytes of Varuṇa, Śoṣaṇa, 'Drying up', and Pāpayakṣman, Consumption, are constant evils. The afflictions that proceed from his inauspicious aspect go as far as the north-west corner, where Roga is stationed; he is Disease, the Shortener of life (anāyus, 'Viṣṇudharmottara, l. c.) according to that branch of the tradition to which belong the 'Bṛhatsaṃhitā', and other texts. Śoṣaṇa, Emaciation and Withering up, is Saturn (Sanaiścara) and his saturnine agent is Pāpayakṣman, Consumption.¹⁰³

Dauvārika, the Gate-keeper is Nandin, and Puṣpadanta, the flower-tusked, is here Garuḍa¹⁰⁴ and they are the Vāhanas, the former of Śiva, the latter of Viṣṇu.

¹⁰⁰ The identifications of these, and the other gods, are given in the 'Samarāṅgaṇasūtradhāra,' XIV. 11-31.

¹⁰¹ R. Guénon, 'Le Symbolisme du Zodiaque chez les Pythagoriciens', 'É. T.' 1938, pp. 224-230.

¹⁰² Coomaraswamy, 'Angel and Titan', l. c., pp. 379, 409.

¹⁰³ Pāpayakṣman, the curse of consumption, had been brought on Soma, the Moon, by Dakṣa. Its position, in the Vāstu, borders in the west on the realm of Soma. Śoṣaṇa and Rājayakṣman as aspects of Varuṇa, 'Jaiminīya Upaniṣad Brāhmaṇa', IV. 1. 7-8.

¹⁰⁴ According to 'Samarāṅgaṇasūtradhāra', Puṣpadanta is also one of the Diggajas, the 8 elephants on which rest the eight regions ('Amarakoṣa').

In the Vāstu they are stationed on either side of Sugrīva, who is Manu, son of Vivasvān Mārtāṇḍa and brother of Yama. Manu is the primordial and universal law-giver, the prototype of 'man' (Manu, Mānava). His place is midway between Nirṛti and Varuṇa, whereas next to Varuṇa, Asura is stationed, whom the Visnudharmottara (l. c.) designates as Yakṣa. This great and principal power is Rāhu. The 'Hayaśīrṣapañcarātra' (VIII. 156) names it Ardha-Vastu; it is the other half, where Existence, Vastu, is the one half. Its station in the Vāstu-maṇḍala however is but one amongst the 45 Vedic divinities. Vastu is extension; Rāhu is duration. The two are brothers. "The wife of Kāśyapa gave birth to two sons: Rāhu and Vastu; the head of the former was cut off by Viṣṇu and the latter was laid low on the earth by the gods" ('Śāradātīlaka', III. 2. Comm.).

The North of the Vāstu is protected by Soma, who is the Lord of Nakṣatras and Vasu, Lokapāla and Āditya in one. This is the region of the birth of form; here the serpents emerge, Nāga who is Vāsuki, and Argala who is Bhujaga having cast their skin; Soma-Kuvera is the Lord of wealth, Soma, the Moon with the lance of his rays is Bhallāṭa; they are flanked by Mukhya on the one side and by Aditi and Diti on the other. Mukhya is Viśvakarman, the maker of all form, who is Vidhātā; Aditi, the boundless, and Diti, the bounded, are both wives of Kāśyapa, who is called Jayanta in the Vāstu; the one is the mother of the Ādityas, the other of the Daityas; production 'per artem'—Viśvakarman—and by nature—Aditi and Diti—occupy the north, the region of Soma, pradakṣiṇa-wise between the regions of death and life, west and east. They are all connected, follow one upon the other, as stages of realisation, and they remain present in the plan.

Outside the Vāstu, in the eight directions, having position but no plots, are stationed homeless presences¹⁰⁵: Śarva-Skanda in the east, Aryaman in the south, Jṛmbhaka in the west, and in the north, Pilipiñjā. Śarva-Skanda are aspects of Agni; Śarva is the fiery essence in the Waters, Skanda is the ninth form of Agni (Kumāra)¹⁰⁶ or, also he is said to be the son of Adbhuta Agni (Mbh. Vana. 225. 2), Aryaman guards the south and in this position he is the chief of the Pitṛs. The story of Jṛmbhaka (Jṛmbhika) is told in the 'Mahābhārata' (Udyoga Parva 9. 60-63). He was created by the gods as a great being to destroy Vṛtra; for Vṛtra had fought with Indra whom he whirled into his mouth. Jṛmbhika is the Yawn; Vṛtra yawned and out leapt Indra. From this time on, Jṛmbhika is part of breathing. The identity of Varuṇa 'ab intra' with Ahi-Vṛtra is confirmed by Jṛmbhaka, being stationed in front of the side of the Vāstu which is ruled over by Varuṇa, and outside it, like his yawn itself and carried there by breath (asu), the breath of the Asura who is Varuṇa: and also Rāhu; placed outside, a sign of fatigue and relaxation in which is release "from the jaws of the monster". Pilipiñjā in the north, incites the Moon (pil-piñja), the Protector of the north, to the continual shaping of living forms.

¹⁰⁵ For the worship of Hari (Viṣṇu) and Durgā, the 45 Devatās have to be worshipped. For the temple of other divinities, the eight outside divinities have to be added. ('Tantrasamuccaya', I. 1. 68-69), the four on the sides and the four in the corners (see p. 32).

¹⁰⁶ Ś.B. VI. 1. 3. 11. Śiva as Śarva presides over the east, (AV. XV. 5. 2); Śarva is one of the eight manifestations of Śiva. Skanda is Śiva's fire-born son, 'Kumāra', the boy, 'Guhā', the mysterious.

This continuing procedure holds the corner position in the north-east under the name of Carakī (from 'car', to move). The powers stationed in the corners are all female; the driving force that is in each two adjacent sides, is stationed outside, let loose so as to avert such evil as might befall the place by the weaknesses corresponding to its own propensities. Vidārī, the Rending one, is stationed in the south-east, Pūtanā, the 'corpse' of a demoness, guards the south-west corner and Pāparākṣasī, the evil fiend, is active in the north-west. The corner positions are defensive ones. The energy (śakti) which is active there is born of the meeting of two different directions, each with its own impulse. This is discharged at the corners to combat an assault from evils akin to itself in nature.

The outside entities on each side, on the other hand, are exponents of the nature of each of the sides; it would be dangerous to leave the Vāstu so exposed. It is defended at the corners, at the turning points, by the demonesses who have come out of it and who, by remaining outside, defend the order of existence against disruption and decay.

Viewed from the centre, where Brahmā is stationed, the twelve inner and thirty two outer gods have their place in due order; it is assigned to them by a two-fold movement, from the centre, in expanding rhythms, and around it, peripherally. Their number, forty-five, is not a square one; their plots are allotted to them according to various patterns consistent with their importance and position. Only the Brahmasthāna remains unchanged as square power of two, and square power of three respectively, in the Vāstu of 64 or 81 squares. It is there that the Supreme Brahman is worshipped, in the centre of the Vāstu's body. The size of the fields occupied by the 12 Ādityas¹⁰⁷, who are actually only eight—their Vedic number—is variable. Their presence all around the Brahmasthāna is equal to the total effulgence, the light that proceeds from the Hiranyagarbha, the golden Germ. Of the 32 marginal divinities, eight preside over the regions of space (aṣṭadīkṣpāla), while all of them are at the same time the regents of time, measured by the stars, over which they preside. The number 32, or four times eight, is derived from the original 4, which again is a repeated application of the balance of the primary binom of polarity, as seen in sunrise and sunset, east and west. In these 4×8 units or fields, the 4×7 regents of the 28 lunar stations are accommodated. Their number, 32, is incomplete however without the central one of Brahmā, from whose immovable position proceeds all display and number. Added to it, their number is thirty three, which is the number of the gods, their sum total in the unity from which they proceed and have their play in heaven, on earth, and in mid-air¹⁰⁸. By these 33 the sacrificial body (yajñatanu) of the Vāstupuruṣa is occupied in its centre and periphery.

The Vāstupuruṣamaṇḍala, sacrificial body of the fallen Asura, is analogous to the ritual body which the sacrificer builds for himself when piling up the Vedic altar. It is one in kind and function with the 32 bricks, 8 in each quarter and one in the middle, called Yajñatanu (Taitt. Saṃh. IV. 4. 9). The sacrificial body

¹⁰⁷ See Figures pp. 32 and 86 f. ; and note 86.

¹⁰⁸ The 33 gods of the Āpri hymns of the Ṛgveda are three times eleven, on earth, in the air and in the sky: Residing on earth their number is equal to $4 \times 8 + 1$.

of the Vāstupuruṣa as the dwelling of the 33 gods is one with the town Śrīkṣetra, with its 32 doors¹⁰⁹.

Brahmā is always stationed in the middle of the body of the Vāstupuruṣa¹¹⁰, whether the latter lies with his head in the east ('Mayamata', I. c., 'Śilparatna', VII. 34. etc.) or as is more general with his head in the north-east¹¹¹. If he lies with his head in the east, this is its original place, towards the rising sun. It is then said that Aryaman is stationed there, Vivasvān and Mahīdhara occupy the right and left side of the body and Mitra is placed on the sex organ; on his arms and legs are stationed the pairs of Ādityas in the intermediate directions. In this position, Vāstupuruṣa is said to lie huddled up (nikubja) underneath the gods; the Padadevatās appear closely stationed around him; he is hedged in by them. He underlies the Brahmasthāna and the zone of the Ādityas; he is surrounded by the Aṣṭadīkṣpālas and the orbits of the sun and the moon. But, if his head is in the north-east, at the feet of Śiva and where Īśāna is stationed, all the 45 gods dwell on his body; Īśāna or Śikhin on his head; his eyes and mouth are held by Parjanya and Āpa; on the chest, to the right and left, are Aryaman and Mahīdhara, whereas Mitra and Vivasvān occupy his belly; his feet are in Nirṛti; he lies from the north-east to the south-west, his arms are stretched south-east and north-west and bent in the elbows, his knees too are bent so that they touch the middle of each side of the square; the knees, where Gandharva and Kusumadanta are stationed, are in the south and west; the sun and moon are on his arms (Ī.P.); they are folded back, so that the hands (palms) come to lie in Rājayakṣmā, the left, in the north-west, and in Savitā, in the south-east, the right one (Br. S.) or alternatively the palms are folded on his chest ('Agni Purāṇa').

Right and left refer to the body of the Vāstupuruṣa fallen, with the head down. The divinities of the east and south are on the right, those of the west and north on the left. Their positions remain unaffected by the orientation of the Vāstupuruṣa; and they are distributed on his intrinsic form, which is the square (caturākṛti) and not on the allusion to the figure of man, which latter acts as a place of reference. The divinities are stationed at definite places of the square form; this has the result that the same divinity is placed once on the head and then again on his chest, to the left, according to the position of the Vāstupuruṣa who faces east or north-east: The Devatās reside on the square form of the Vāstupuruṣa and by implication only on his fallen shape. It is the form of the

¹⁰⁹ Cf. also the lotus of Ākāśa with its thirty-two petals. Mus, 'Barabuḍur', op. cit., p. 701 f. The symbols of Śrīkṣetra, Ayodhyā, and the Vāstupuruṣamaṇḍala are plans in which manifestation is laid out, with reference to the Principle beyond it, and in its centre.

¹¹⁰ 'Mayamata', VII. 49; 'Bṛhatsaṃhitā', LII. 51.

¹¹¹ The majority of texts place the Vāstupuruṣa with the head in the north-east; 'Bṛhatsaṃhitā', LII. 51; 'Matsyapurāṇa'; 'Vaikhānasāgama'; 'Kāmikāgama'; 'Mayamata'; 'Īśānaśivagurudevapaddhati'; 'Hayaśīrṣapañcarātra'; 'Samarāṅgaṇasūtradhāra'; 'Kāśyapaśilpa', 'Manuśyālayacandrikā', II. 28; etc. (see notes 45, 46). In some of them, the alternative position, with the head in the east is described in detail ('Mayamata', 'Śilparatna') and quoted as the opinion 'held by others'. In other texts, the two possibilities are not kept apart; they are combined in the 'Vāsturājavallabha', II. 1-2, where the Vāstupuruṣa is described as placed by the gods on the ground with his face east. The feet should be worshipped in the south-west; the head in the north-east; cf. also 'Mānasāra', VII. 255.

THE GODS AS CONSTITUENTS OF THE 'BODY' OF THE VĀSTUPURUSA

Vāstupuruṣa which has a given number of spines; veins and vital points are held together by these lines of which the prototypes are measurable in terms of breath, 'Prāṇa' and 'Vāyu' (p. 51). As in man whose "inner self, which consists of breath, has also the shape of man", so conversely this form, which consists of breath is named Puruṣa. The form has been laid out on earth at the end of the Perfect age, the Kṛta-yuga, when the 'Gale of the Spirit' still blows, as Prāṇa and Vāyu which are the threads (sūtra) that hold it together. "The stronghold (pur) doubtless is these worlds, and the Puruṣa (Spirit) is he that blows here (the wind); he bides (ṣi) in this stronghold (pur); hence he is the Puruṣa" (Ś.B. XIII. 6. 2. 1).

The gods are settled on the Vāstupuruṣa. The fight between the demons and the gods is over for it is won conjointly. Every building activity means a renewed conquest of disintegration, and at the same time a restitution of integrity so that the gods once more are the limbs of a single 'being', of Existence, at peace with itself.

IV

THE SUBSTANCES OF WHICH THE
TEMPLE IS BUILT

अथाषाढामुपदधाति । इयं वाऽषाढा । इमामेवैतदुपदधाति ।

“He then lays down the Invincible Brick. The invincible one being the earth, it is this earth that he thus lays down.”

‘Śatapatha Brāhmaṇa’, VII. 4. 2. 32.

अव्यङ्गे चाक्षते पूर्णे मुनेरङ्गिरसः सुते ।

इष्टके त्वं प्रयच्छेष्टं प्रतिष्ठां कारयाम्यहम् ॥

“O daughter of the sage Angiras. Thou unbroken, unhurt and full in size, O Brick, grant thou the desired object.—I now instal thee.”

‘Agnipurāṇa’, XLI. 17.

‘Hayaśīrṣapañcarātra’, XII. 257-8.

IV

THE SUBSTANCES OF WHICH THE TEMPLE IS BUILT

BRICK

A large number of stone temples are preserved¹ though few brick temples². In some the substances are combined, wood or stone for example being used for the door frames of brick structures³, or stone being employed for the walls and

¹ They are built of the stones which are quarried in the various parts of India ; sandstone prevails in central Indian temples ; limestone or marble is frequent in western India ; trap in the Deccan ; a fine grained, black chloritic schist in the later Cālukya temples of the Kanarese districts in the Deccan ; a similar stone, quarried in the Rajmahal hills is also used in Bengal for door frames, etc., of brick temples ; granite in south India ; laterite and sandstone, etc., in Orissa. The earliest stone temples are preserved from about 400 A.D. In Gujerat and Rajputana the stones were carved, pieced together and placed in position. In the Kanarese districts and the Deccan the details, in some cases were carved in situ. In Orissa, the carvings were finished in situ. On the walls of the hall of the Rājarānī temple in Bhuvaneśvar, the design is blocked out and has not been completed.

² The 'Matsyapurāṇa', Ch. CCLXIX, describes the possible forms of the Hindu temple (see Part VII) and says that they may be built either of wood or brick or stone.

Utpala, commenting in the tenth century on the 'Bṛhat Saṃhitā' (LII. 39-41), quotes Hiranyagarbha ; according to him the range of substances used in definite types of buildings was large. The building Mandira, was made of stone, Vāstubhavana of baked bricks, Sumanta of unbaked bricks, Sudhāra of mud, Mānasya of wood, Nandana of bamboo, Vijaya and Śilpivikalpita of [tent] cloth, Kaṭima of wattle and others of gold, silver, copper, iron, lac and tin. According to Maya there are only five kinds of buildings of different substances.

In the early eleventh century, the 'Samarāṅgaṇasūtradhāra', XLIX. 6-7, speaks of the Prāsādas which should be built in towns (nagara). They are to be built of stone and baked bricks. In chapter LIX. 217-239, details are given of the wooden temple Harnya, the rock-cut temple Layana, the cloth made temple Paṭṭisa, etc.

In the 'Īśānaśivagurudevapaddhati', Part V. Ch. XXXII. 86-89, about the same time, the South Indian type of temples is said to be 'saṃcita', 'asaṃcita' and 'upasaṃcita' according to its 'density', and is considered male, female or neuter, respectively. In the first instance it is built of stone or brick, in the second of brick or wood, and lastly of brick and wood combined. These terms however have a much wider meaning in other southern texts, such as 'Mayamata', XX. 31 f. and the 'Mānasāra'.

³ Among the earliest of preserved brick temples are : the temple at Bhitargaon, in the United Provinces, of the Gupta age (5th century) ; the Uttareśvara and Kāleśvara temples at

brick for the superstructure⁴. Brick and wood, singly or combined, were it seems frequently used but being easily perishable have vanished to a much greater extent than the contemporary buildings in stone. Wooden temples are however even now preserved and in worship in two distant parts of India, namely in Malabar, the ancient Kerala, and the Himālayas⁵.

Bricks had formed the "body of the sacrifice" (yajñatanu)⁶. Detailed prescriptions are given how to make good baked bricks and this practical knowledge gained by experience accompanies a sacred memory (smṛti), a tradition by which the acquired technical skill became perfected.

The act itself of offering had gone into the making of the brick. It is a rite of identification. The substance of the brick is its carrier, earth and fire are the

(Tagara) Ter in Hyderabad, Deccan; their doors, beams and ceilings, are of wood (about 7th century); the Lakṣmaṇa Temple in Sirpur, Central Provinces, 7th century, the door frame being of stone (Coomaraswamy, 'History of Indian and Indonesian Art', Pl. LI). Among Buddhist temples, the outer circular brick wall and the inner circle of wooden pillars of the temple at Bairat, Jaipur State, Rajputana, date from the 3rd century B.C. (D. R. Sahni, 'Archæological Remains and Excavations at Bairat', Jaipur 1937; Stuart Piggott, 'The Earliest Buddhist Shrines', 'Antiquity', 1943, pp. 1-10). The temple at Paharpur, North Bengal (Memoir, ASI. No. 55, by K. N. Dikshit) rising with 3 terraces on a cross shaped plan with recessed sides, of the 8th century (and a similar Stūpa structure unearthed at Lauriya Nandangarh, Bihar, 'Annual Bibliography of Indian Archæology', 1936, p. 4).

⁴ In South India, the walls of the temple are generally of stone; the flat stone ceiling of the Garbhagrha is supported on teak wood joists; the superstructure is of brick. See also note 76. In another combination the structure is of brick and its life-size sculptures are of sandstone as in the ruined brick temple of Rajapadar, Sonpur; (ASI., vol. XIII. p. 120).

⁵ The wooden temple at Brahmor, Chamba, (J. Ph. Vogel, 'Antiquities of Chamba State', p. 96) of the early eighth century is the most ancient in the Himālayan group. On the Malabar coast, wooden temples represent the indigenous types of architecture; preserved temples date from the 14th century (R. V. Poduval, 'Administration Report of the Archæological Department', Travancore, 1941, p. 4; the temple at Śāttankulaṅgara, Central Travancore).

⁶ 'Taitt. Samh.', IV. 4. 9. Thirty three rhythmic formulæ accompany the bricks called Yajñatanu, 8 in each quarter and one in the middle. In their position they correspond to the 32 Padadevatās and the Brahmasthāna of the Vāstupuruṣamaṇḍala.

⁷ The 'Mayamata', XV. 114-120 for instance, instructs that soil free from gravel, stones, roots, bones and clods should be selected, having fine sand, of uniform colour and pleasant to touch. First one should throw a lump of earth into knee-deep water, and then stir and knead it repeatedly forty times with one's feet. One should wet it with waters of Kṣīra (pine), Kadamba, Āmra (Mango) and Abhayākṣa tree bark and the water of the 3 fruits (Āmalaka=emblic myrobalan, Bahela and Haritaka) and go on kneading it for a month. Then the bricks of 4, 5, 6 and 8 mātras (aṅgulas) in (width) and twice as long respectively and half, or one third, or equal to the given width in thickness, should be thoroughly dried and then evenly baked; after an interval of one, two, three or four months they should be thrown into water, by the expert; thereafter they should be taken out of the water and dried completely, and then used in the desired undertaking.

The bricks must be freshly made and all the other building materials too must be hewn or quarried in due time, and used exclusively for the building for which they are destined. The 'Mayamata' XV, 61f., 121, enjoins that wood, bricks, and stone should be collected in the approved manner as the ancients have condemned building materials left over from other buildings and those taken from ruined buildings cause distress.

The prescription of the 'Viṣṇudharmottara' about the making of bricks is given in Pt. III. Ch. XCI. 3-11.

elements which take part in it and help the sacrificer to build his sacrificial body. It is made of bricks. It can neither be seen nor known by those who see but a brick in a brick and ignore that its number, measure and position make visible its function in the sacrificial altar; for it is made and put into its position in execution of a sacramental will to which it gives a body. This is piled up physically, while it is imbued with an invisible Essence. The fabric of the altar is of a special kind and with it also are moulded the thick, piled up walls of the Hindu temple.

In the building of the temple, the bricks—it will be shown that also the building stones are thought of in this connection as bricks—are as if pressed from the centre towards the perimeter by the small hollow of the Garbhagr̥ha, the innermost sanctuary of the temple; massively piled, they are its walls. These now are replete with the special substance of the bricks and they widen the perimeter of the temple with mouldings and fillets in the horizontal and by buttresses and various kinds of projections, in the vertical direction. The body of the temple substantially steps across its own limits, enlarges its perimeter with compact pilasters and turrets, and makes its rhythm proceed from the centre in the oscillations of its elastic boundary. There are many possibilities of the articulation of the perimeter of the temple; each has a name and definite proportions.

The impact of the outward movement is caused from the small internal cavity, the innermost sanctuary. The Vedic Agni was a massive pile with no other cavity than those of the Svayamātr̥ṇās, the naturally perforated stones. Through these perforations the altar 'breathed'; the Prāsāda, the main and integral part of the Hindu temple, is nearly a solid monument but for the small space of its sanctuary and such technical devices which lessen the weight of the mass piled above it. It is closed on top. With the inclusion of the small space in the innermost core of the mass, a pressure as it were is exerted on it from within; it impresses itself on the bricks. Acted upon from within horizontally, they appear to discharge it in the outward direction. The pressure acts figuratively and not dynamically or mechanically, for the Hindu temple is more a solid monument than a work of 'architecture'. As in the piled altar, each weight rests on its support, and there is no lateral thrust. The buttresses are not technically indispensable.

A monument stands in space, it does not face it. The Hindu temple too, has strictly speaking no façade; the four orients and the intermediate directions of space step forth in buttresses and images from the body of the temple in a continuous integrity of the mass analogous to the variable pattern in which the divinities are laid out on the Vāstupuruṣamaṇḍala. In the structure of the temple they refer to and have their position, from the central square of the innermost sanctuary, the Garbhāgāra; it corresponds to the Brahmasthāna, in the plan. In this way the bricks partake in the form of the temple which is more a monument than an edifice. With reference to the Vedic Altar it is thus known: "In the fire the gods bathed him (Prajāpati) by means of oblations; and whatever oblation they offered that became a baked brick and passed into him and because they were produced from the offering (iṣṭa) therefore they are bricks (iṣṭakā); and hence they make the bricks by means of the fire, for it is oblations they thus make" (Ś.B. VI. 1. 2. 22. f). The baked brick here is the middle term of the oblation and of Prajāpati, it is the place of its transubstantiation. Similarly, the following are

invoked and beheld in the bricks, when a temple of Śiva is built⁸: the subtle body of eight components apportioned to man (puryaṣṭaka)⁹; the eightfold manifestation of Śiva (aṣṭamūrti)¹⁰; the Pure Principles, and all the other principles and forms of manifestation (tattva) including the 'impure principles' of the world of duality.¹¹ The oblation here is man himself in his subtle body, and its eightfold correspondence in the manifested universe. One by one, the lower Tattva is offered to and absorbed in the next higher until the Pure Principles are reached and then merged and re-integrated in Niṣkala Paramaśiva, the Supreme Principle,¹² in whose presence the temple has its ultimate destination.

Through the fire in which it is baked, the sacrificial essence remains burnt into the brick, in its substance, which is earth. This is feminine in its nature; it is the original substance to be shaped, and to be laid down in the piled up monument on sacred ground. It retains its full Vedic meaning in the structure of the Hindu temple for one of the most widely used names for the temple proper, the main and integral building, is 'Prāsāda'. This name derives from 'sādanam' the settling of the bricks in the Fire altar (Ś.B. VI. 1. 2. 28).¹³

They are settled with the Sādanam mantra which makes them lie steady and firmly established ('Vājasaneyi Saṃhitā'; XII. 53). Each brick made of earth shares in the nature of the earth, is earth. What is required of her, the steadiness, the firmness, is equally necessary to each layer of the monument as it is raised up.

The brick is this earth and the first brick to be laid down anticipates and represents each subsequent one. The first brick is called Aṣādhā, the invincible (Ś.B. VI. 5. 3. 1). "The invincible one being the earth, it is this earth that is laid down with the first brick" (Ś.B. VII. 4. 2. 32). "Now this earth is four cornered . . . : hence the bricks are four-cornered; for all the bricks are after the manner of this earth" (Ś.B. VI. 1. 2. 29). "The first brick of clay is this earth—whatever made of clay he places on that (altar) that is that one brick" (ib. 30).

When the bricks are laid rhythmic formulae (mantra) are recited to ensure that they lie steady and firm; thus with speech and breath they are laid; their substance is now imbued with Vāk (speech) and with Breath (Aṅgiras; Ś.B. ib. 28). In this way the bricks are Agni's limbs (ib. 31). The brick is Earth and Vāk, for this earth was made first (Ś.B. VII. 4. 2. 32-34) and Vāk is the Word which was in the beginning and is activated into utterance again and again with every brick laid down in the sacred structure. Being Earth and the Word, the brick

⁸ The exact analogy in the case of a temple built of stone (śilā) is given in the 'Agnipurāṇa', XCH. 32-65.

⁹ The Puryaṣṭaka comprises: 'Buddhi, ahaṃkāra, manas' and the 'tanmātras: Śabda, sparśa, rūpa, rasa, gandha'; this is: intellect, the sense or notion of 'I' ness or individuation, mind and the 5 elementary essences or sense principles, hearing, touch, sight, taste and smell. The latter are 'essences' in their relation to the 5 corresponding substances, ether, air, fire, etc.

¹⁰ The eight manifestations of Śiva are: earth, fire, man as sacrificer (priest), sun, water, air, moon and sky.

¹¹ The Tattvas, the principles and forms of manifestation, are the ontological stages of manifestation of and by Consciousness, of the Supreme Śiva, who is the Supreme Principle, non-manifest, without attributes and qualities (niṣkala).

¹² 'Īśānaśivagurudevapaddhati', III. Ch. XXVII. 71. f.; 'JISOA', vol. IX. pp. 151-193, trans. St. Kramrisch.

¹³ Sādanam, from 'sad', to seat or settle, means seat, house, etc.

is a goddess: "To thee, O Goddess, O Brick, let us sacrifice with oblation" ('Taitt. Samh'. IV. 2. 9. 4). The goddess is incorporated in the densest elementary substance, earth, for she is the Word as the body of the universe.

She is invoked in the bricks of which the Vedic altar is piled and the Hindu temple is built. "O daughter of the sage Aṅgiras, thou unbroken, unhurt and full (in size), O Brick, grant thou the desired object." With these words the brick is laid down and established (its 'pratiṣṭhā' is performed. 'Agnipurāṇa', ch. XLI. 17; 'Hayaśirṣapañcarātra', ch. XII. 257-58)¹⁴. As the daughter of Aṅgiras¹⁵ (Breath) she is immortal, a goddess, and many are her names. It has been breathed into her and so she is a sister to the Vedic hymns, whose father too is Aṅgiras. Having gone through the fire and having been given form, Earth as Brick is equivalent to the Word, Earth, all the same, herself retains her own significance in the same rite when in the base of the temple the Garbhādhāna¹⁶ is performed, when the Germ of the temple to be built is implanted and steadied in the womb of mother Earth.

'Iṣṭakā-nyāsa', the installation of the bricks, is performed as part of the main foundation rite of the temple. It takes place after the foundation pit has been dug; in extent the foundation pit is coterminous with the boundaries of the Prāsāda¹⁷; in depth it is equal to the height of man standing with raised arms¹⁸, or it is dug to the rock-bottom or until gravel is reached or the water level¹⁹ according to the geographical conditions of the site. After the pit is dug, it should be filled with pure earth, eight finger widths (aṅgula) high; on this layer another one is placed, one cubit in height and composed of layers of strong stones each embedded in wet earth and separated one from the other by sand and earth; when the foundation has been laid so far, it is moistened with water, trodden by elephants, and levelled with heavy wooden stampers. On top of this, it is firmly packed²⁰ and when one fourth of the pit remains²¹ the first bricks are laid. They

¹⁴ Both these texts ('Agnipurāṇa', incorporating 'Hayaśirṣa-pañcarātra', for the respective chapters in the 'Agnipurāṇa' begin with "Hayagrīva said") specify: "The Śakti Vimalā, etc., are the deities of the bricks. They should be installed, as is proper" (A.P. Ch. XLI. 16., H.P.R. Ch. XII. 256).

¹⁵ Aṅgiras (cf. Agni). His daughters are the Vedic Hymns. His daughters too are the bricks of the Vedic altar and of the Hindu temple. Aṅgiras is also one of the 10 Prajāpatis, (see note 60).

¹⁶ RV., X. 184. 1. 'Agnipurāṇa', Ch. CLII.

¹⁷ 'Īśānaśivagurudevapaddhati', III. Ch. XXVII. 40-41.

'Hayaśirṣapañcarātra', VIII. 136, prescribes: "make a square, equal to the perimeter of the building after the ground has been made level as water or a mirror."

¹⁸ 'Īśāna-paddhati' ibid., 'man' is the yajamāna, the patron (kāraka); the depth of the foundation pit here is one 'puruṣa', as deep as the patron's own maximum measure.

¹⁹ ib., and 'Tantrasamuccaya', Pt. I. I. 59; further positions of the depth of the foundation pit are mentioned in the 'Pratiṣṭhāpaddhati' (see next note).

²⁰ 'Pratiṣṭhāpaddhati', quoted in 'Īśānaśivagurudeva-paddhati', ib. f. The solid foundation described in the texts is not the only kind. Another type has been preserved in Sirpur (near Raipur) C. P. below brick temples of the 7th-8th century. They are built on hollow oblong cell foundations with slate stone walls. Near the level of the intended basement or floor of the temple, the cells are made to diminish by corbelling till the space is so small as to be covered by thick, strong slabs. The walls of the temple rise from a level terrace of strong

are deposited below the place where the right door jamb of the main entrance to the temple will be set up.²²

Five or nine 'bricks' are thus laid down, one in the centre of a square, the others²³ in the cardinal and intermediate directions following the course of the sun (pradakṣiṇā) beginning from the east.²⁴ They must not be laid on the vulnerable vital spots (marma).²⁵ The shape of these first bricks is given variously, as square²⁶ or rectangular that is a double square the thickness being one third or one fourth of the width²⁷; the latter type prevails. Their size varies with the size of the temple²⁸. These bricks then are laid evenly and on one level, into the pit.²⁹ Then the pit should be filled up³⁰ and above it, in course of constructing the base of the temple, the rite of Garbhādhāna is to be performed and the vessel which holds the Seed and Germ of the Prāsāda is to be deposited on the ground, on the lowermost moulding (upāna) or on the topmost moulding (prati) of the base,³¹ according to the status of the patron, whether he be a Brāhmaṇa, Kṣatriya, or belongs to a lower caste. With the status of the donor thus embedded in

slabs which cover the cell foundation. The depth of the wall of the foundation cells is described as 25 feet; its thickness being about 4 feet. (Cunningham, A. S. I. vol. VII. p. 172 f.).

²¹ 'Mayamata', XII. 110-111. Some say that the first bricks should be laid when two-fifths of the pit remain.

²² 'Kāśyapaśilpa', IV. 46, the first brick should be placed to the right of the door in Prāsāda and Maṇḍapa. 'Īśāna-paddhati', I. c. śl. 63.

²³ The rite is described in detail, in the 'Īśāna-paddhati', I. c. and in the 'Bṛhatsaṃhitā', LII. 112; 'Viṣṇudharmottara', Pt. II. ch. XXIX. 78 f. (the "laying of the stones": 'śilānyāsa').

²⁴ According to the 'Vaikhānasāgama', ch. v., called 'Prathamāśileṣṭakā-vidhi', (see however 'Bṛ. Saṃh.'; 'Viṣṇudharmottara,' etc. I. c., see note 42. According to 'Śilparatna', XII. 26).

²⁵ 'Śilparatna', XII. 13.

²⁶ 'Agnipurāṇa', XLI. 3, with 12 aṅg. width (this is the same as the width of the brick of the Vedic altar, p. 47). The stone bricks measure 1 cubit (hasta). Aṅgula is the width of the upper digit of the thumb, 'Piṅgalāmata', ch. IV. JISOA, vol. XI. pp. 9-31, text and translation by P. C. Bagchi.

²⁷ For the very best, i.e. the very largest, temples the proportion of the 'first bricks' is: one cubit (24 aṅg.) long, 12 aṅg. wide and 8 high. 'Īśāna-paddhati', I. c., 64-65; 'Śilparatna', XII. 17-18. For the three other classes, the large, middle and least shrines, the height is one-fourth of the length; 'Śilparatna', XII. 17-21; cf. 'Mayamata', XII. 104; 'Īśāna-paddhati', I. c. 67-70.

²⁸ 'Mayamata', XII. 104, gives the width in a relative measure, i.e. equal to the receptacle of the Garbha. The 'Kāmikāgama', LI. 6, states that the width (vistāra) varies from 3 aṅgulas to 30 aṅgulas increasing by 1 aṅgula. 'Śilparatna', XII. 17-23, indicates sizes ranging from 8 to 38 aṅgulas or from 9 to 39 aṅgulas according to the proposed number of stories of the building and the 'Mānasāra', XII, 189-193, a size from 7-30 aṅgulas, with an increment of 2 aṅgulas. The latter text also admits rectangular shapes of smaller proportions than the double square. The standard proportion is the one indicated in note 27, and considerable latitude was given in the actual measures, according to the exigencies of particular buildings.

²⁹ Each is placed on the mouth of a 'treasure jar' of copper; 'Ī.P.', I. c. 71 f.

³⁰ After once more having been filled with water; then the foundation should be packed with stones or bricks ('Ī.P.', I. c., 71 f.). This is one method of laying the foundation.

³¹ 'Ī.P.', I. c., 73-74; 'Tantrasamuccaya', II. XII. 6, slightly different and with more detail; 'Mayamata', XII. 107-110.

the temple, the intellectual level is indicated from which he begins his ascent. Above this base and this inbuilt distinction of 'level', the ascent is one and the same for all the castes. Those who are of no caste, the outcastes and the foreigners, the Mlecchas, they have no ground and footing within the body of the temple and their ascent is from the outside, performed by sight, a 'darśana' to which the highest point is visible from afar. The four castes in their hierarchy deposit the seed of the temple at a level which is appropriate to them. This distinction is made and remains within the base of the temple only, it does not proceed further. Another reference to the status of the donor is given in the designation of the bricks. They are distinguished as male and female conforming with the sex of the donor,³² so that the approach to the identification is more closely adjusted between patron or donor (kāraka; yajamāna) and his gift.

³² 'I.P.', I. c., 67-70; 'Mayamata', XII. 105-107; 'Mānasāra', XII. 194-195, moreover, distinguish neuter bricks. These distinctions are made according to the thickness of the bricks; if bigger at the base, for instance, the brick is declared as female. Such slight variations in the standard shape of the bricks are welcomed as indicative of affinities. 'Śilpa-ratna', XII. 16-17, advises male bricks for men, and female bricks for women donors, or also male bricks for either. 'Mayamata', XII. 105 f. distinguishes the sex of the bricks according to their even (m.) or odd (f.) number of aṅgulas, etc.

STONE

"Iṣṭakā", produced from what was offered (iṣṭa, Ś.B. VI. 1. 2. 22), is used as the name not only for the brick but also for the stone or wood of which a temple is built. "For temples built of stone, the first "bricks" are of stone; for shrines built of wood, they are of wood, or else earthen bricks are employed for all kinds of temples (Vimāna)³³. By its symbolic significance the brick has precedence over stone and wood.³⁴ Stone is used as its substitute. The installation however of the first stone (ādhāraśilā) has its own rite, too.

Stone temples have no place in Vedic rites. Their altars were brick piles and embodied metaphysical knowledge. The Svayamātrṇṇā, the naturally perforated "bricks" in the centre of the Agni (Ś.B. VIII. 7. 3. 13; VIII. 7. 4. 1), were most probably a special kind of stone. Sheds (śālā) connected with the sacrifice and built of wooden or bamboo posts, beams, a roof ridge (vaṃśa) and mats, had accessory importance.³⁵ Wood and tree are symbols in their own right. Their form has retained its integrity in the Hindu temple even where their substance has been substituted by other more lasting materials, such as brick and stone.

The rites of laying the first stone are largely in imitation of those of the laying of the first bricks; the rites connected with the quarrying and the carriage of the stone are akin to the rites of felling the tree and transferring it to its destination. Stone, employed in India, as elsewhere from the stone age for sacred purposes,³⁶ has taken the place of brick and wood in the building of many temples. Where it has not retained the logic of its own form, it has also taken over the meaning of their substance. To judge from preserved monuments, stone,—the prism, the rectangle and the square—remained in its own pristine architectural form, for several centuries after the temple of aboriginal prototype, the stone dolmen, in worship to this day amongst the Gonds³⁷ in central India, in the south of India,³⁸ and elsewhere, had been given relatively large size and careful workmanship. The earliest preserved temples of this type date from about 400 A.D., especially

³³ 'Hayaśirṣapañcarātra', XI. 234; 'Śilparatna', XII. 14-15; 'Kāśyapaśilpa', IV. 19 advise stone for the foundation of mixed brick and stone buildings.

³⁴ In domestic architecture, wood and light wood (bamboo), etc., were at least made as much use of as clay and bricks.

³⁵ 'Śatapatha Brāhmaṇa', III. 1. 1. 6; Śāyaṇa, on 'Taitt. Samh.' I. 2. 1.

³⁶ Dolmen, etc., see Part V.

³⁷ P. C. Mukherji, 'Report on the Antiquities in the District of Lalitpur, Roorkee, 1899.

³⁸ "Often a large rough stone with no carving on it is stuck up and serves for shrine and image alike." Whitehead, 'The Village Gods of South India', p. 35. The shrine of Pōleramma, ib. Pl. XV. has one large flat stone, its roof, supported by several upright flat stones and is practically a dolmen; Pls. V. and VI., ib. are further varieties of the Dolmen type; the monolithic uprights are replaced by courses of smaller stones (Pl. V). The shrine of Poṣhamma, Pl. IX., is a more complex temple of this type, a hollow cube, with a separate door frame, and a number of large flat stone slabs are laid in the shape of a recessed pyramid on top of the flat roof. It is surmounted by a finial. See Part V, notes 53, 55.

in central India. Their unadorned walls consist of a few courses of relatively large stones dressed to level beds and joined without mortar; their roof of stone is flat.

From the sixth century A.D. onwards, the time of the compilation of the earliest preserved treatises on architecture, stone is one of the accepted materials.³⁹ It has its ritual which is partly identical and partly analogous to that of the bricks, a well defined destination, and due consideration is given to its own nature.⁴⁰

The 'Matsyapurāṇa' (CCLXVI, 5-18) speaks of the Brahmaśilā, the Brahma-stone,⁴¹ and its consecration. The Brahma-stone forms part of the 'support' (ādhāra), of the temple to be built.

The 'Viṣṇudharmottara' (Pt. II. ch. XXIX. 78), describes the laying of the first stone (śilānyāsa). A stone jar should be placed in the centre of the Vāstumaṇḍala of 64 squares and the stones, anointed and covered with cloth should be laid down, following the course of the sun, and beginning from the north-east.⁴² The 'Bṛhat Saṃhitā', LII. 112 also describes the laying down of the stones: they are to be known as goddesses. The 'Vaikhānasāgama' (V) regards the four stones as the four Vedas. They should be laid in the 4 directions beginning from the East.

³⁹ Brick, and also stone were used and are preserved in the sacred buildings and their accessory parts, in the third, and the second and first centuries B. C. respectively.

Lithic in its construction and not only in its substance is the solid stone fence unearthed in Besnagar, Bhopal. It belonged to an "Uttama Prāsāda" of Vāsudeva—only its brick foundation exists—of which also the Garuḍa stone pillar with the inscription of Heliodoros, son of Dion and an inhabitant of Taxila, formed part (see also ASIAR, 1913-14, Pt. I.). These relics date from the 2nd century B.C. The balustrade of the terrace of the Buddhist Stūpa of Amarāvati, Kistna district, similarly consisted of uprights with a rectangular slab morticed between. The majority of the stone railings, such as those in Sāñcī, Barhut, etc. are stone versions of wooden prototypes.

The Mora well inscription from Mathurā of Mahākṣatrapa Śodāsa, of the 1st century B.C. speaks of a temple, a "śailadevagr . . ." a "stone house of god" where 5 images in stone of the holy Pañcavīras of the Vṛṣṇis were installed. No trace of this temple is left ('Epigraphia Indica', XXIV. ; J. N. Banerjea, JISOA, Vol. X).

Another inscription of the 1st century B.C. from Nāgari, Udaypur, Rajputana ('Ep. Ind.', XXII, p. 204) says: "This 'pūjāśilā-prākāra', enclosing wall, round the stone (object) of worship, called Nārāyaṇa-Vāṭikā (compound) for the divinities Saṅkarṣaṇa-Vāsudeva has been caused to be made by (the king) Sarvatāta who is a devotee of Bhagavat (Viṣṇu) and has performed an Aśvamedha sacrifice." Part of a high stone enclosure is preserved; but only a brick platform on which stood a temple of brick or stone. The stone fence consists of large stone slabs inserted in grooved stone uprights; in this technique also are the perforated screens or windows set into the walls of Gupta temples in central India and in the Lad Khan Temple in Aihole (Bijapur District).

Of subsequent inscriptions referring to stone temples, the Eran stone boar one speaks of the 'śilāprāsāda', the stone temple of Toramaṇa ('Corpus Inscr. Ind.'), a Viṣṇu temple, it appears; and the Gwalior stone inscription of Mihiragula designates this stone temple (śaila-maya prāsāda) as one of Sūrya, the Sun.

⁴⁰ A detailed study of the qualities of specific stones, their marks, etc., is made in 'Śilparatna', XIV, 2-14.

⁴¹ 'Īśānaśivagurudevapaddhati', III. ch. V. 9. (trans. JISOA vol. X. p. 221).

⁴² From the south-east, according to 'Br. Saṃh.', LII. 110, from the north-east, according to the V. D., 1. c.

The relation of the stone and the brick in the rites of laying the foundation of the temple is multiple. Where the stones are considered altogether as 'brick' or their substitutes, the mantras by which they are invoked are the same; the stone-bricks may be relatively larger than the earthen ones.⁴³ The ritual stone foundation is always laid in the centre of the pit in accordance with the central structure and symbolism itself of the Vedic Agni. The ritual brick 'foundation' however is below the door-jamb, it underlies and pre-faces its vertical direction.

There are thus two distinct foundation rites of the stone buildings; either of them is performed in the centre of the pit. The one is based on the *Ādhāraśilā*, the support given by the first stone, to the total structure. Its symbolism proceeds in the vertical, from the Omphalos or *Nābhi*, which here appears as *Ādhāraśilā*.

The other rite follows closely that of the laying of the first bricks. There the stones or bricks are spread out horizontally and demarcate a square. Above this 'altar', in the case of actual bricks, the *Garbhapatra*, the vessel which holds the *Garbha*, is immured in the building.

The rites of the central stone foundation are indicated in the relatively early texts, such as the '*Matsyapurāṇa*' and the '*Viṣṇudharmottara*'. They are described explicitly in later texts.⁴⁴

In the middle of the foundation pit⁴⁵ and after three-fourth of it has been filled, the *Ādhāraśilā* is laid down. According to the '*Tantrasamuccaya*' I. ch. I. 74-89, and the '*Śilparatna*', X. 6-13, a treasure jar (*nidhikalaśa*)⁴⁶ made of stone or copper is placed on the *Ādhāraśilā*; on the jar a stone lotus is placed, on the stone lotus a stone tortoise, on the stone tortoise a silver lotus and on it a silver tortoise, on the silver tortoise a gold lotus and on it a gold tortoise. From there a funnel shaped tube, the *Yoganāla*, made of copper leads up to the plinth (*janman*; '*Śilparatna*', I. c.) or to its lowermost moulding (*upāna*; '*Tantrasamuccaya*', I. c.). In the treasure jar is invoked *Bhuvaneśi* as Greatest *Śakti*, Holder of the *Āsana*, the seat or foundation of the temple.⁴⁷ The several symbols strung together in the vertical direction illustrate the meaning expressed in words: the sun strings these worlds to himself on a thread of his rays (*Ś.B.* VII. 3. 2. 13). The hierarchy of existence is shown here by the different substances

⁴³ '*Hayaśiṅṣapañcarātra*', VIII. 141-42. "a stone or brick of good quality should be placed in each of the 4 directions."

⁴⁴ To this day, the foundation rite is called in Amritsar for instance, '*śilā-sthāpan*' the setting up of the stone ('*Indian Antiquary*', vol. XXXVIII. p. 122 f.).

⁴⁵ '*Tantrasamuccaya*', I. ch. I. 89, states clearly that the position in the middle of the pit, where the first stone, the support of the building is to be laid, is altogether distinct from the plot assigned to the first bricks; in all the texts unanimously this is to the right side of the door of the temple, below the door jamb. The 'first stone' is laid on one level (that is when three-fourths of the pit are again filled) with the first bricks.

⁴⁶ In the '*Viṣṇudharmottara*', the jar is prescribed to be of stone only. Copper-jars are prescribed in the rite of the first bricks, in the '*Īśānapaddhati*', I. c., and elsewhere.

⁴⁷ During excavation at Gokul, near Mahasthān, Bogra, Bengal, the *Ādhāraśilā* of the temple was found in the centre of the structure. It is a stone slab with 12 small holes and a bigger hole in the centre; in the central hole was a rectangular piece of gold embossed with the figure of a bull. The stone slab lay four brick courses below the level of the innermost central pit. ASIAR. 1935-36, p. 67.

of the symbolic forms. Stone, here is the last support, the rock bottom on which is firmly established the vertical order. The prototype of this kind of vertical symbolism was built into the Fire Altar (Ś.B. VI. 2. 3. 1-5).⁴⁸ In Hindu inward worship (antaryāga, inner sacrifice) this vertical symbolism is present in the meditation called Pīṭhapūjā, the worship of the 'basis' or 'support'.⁴⁹

In the centre of the 'ātman' or body of the Fire altar above the bundle of grass, which was the first 'iṣṭakā' or "brick"⁵⁰ of the first layer the priest (Adhvaryu) placed a lotus leaf, a golden disc, a golden man and on the golden man the first naturally perforated 'brick' (svayam-ātrṇṇā) or self-holed stone; at a prescribed distance to the east of the centre, he set down a living tortoise on lotus flowers, so that it faces the golden man. The lower shell of the tortoise represents this terrestrial world and the upper shell is the air world (antarikṣa) (Ś.B. VII. 5. 1. 2). In the foundation of the temple, the stone tortoise too has to be set down first by the side of the treasure jar and then only is it placed on that jar and above the lotus.

No golden man forms part of the symbols in the foundation of the temple. His identity is absorbed in the Vāstupuruṣa. The place of the golden Puruṣa is now occupied by the Vase, full of power (śakti).

This means a transfer of spiritual levels; no golden disc—the sun's orb—is placed below the vase; it rests on the Ādhāraśilā which is not round but square, and not of gold but of stone. Above the Śakti-vase is placed the lotus made of stone, an unfolding of all the possibilities such as are in the Ādhāraśilā, and on it rests the stone tortoise, who is Viṣṇu⁵¹, the stability⁵² of this world. Śakti and Viṣṇu are part of the 'support' of the temple; and stability is exemplified in the three superimposed regions of the earth-world, the air-world and heaven by the stone lotus and tortoise, the silver lotus and tortoise and finally their golden replicas. This picture of stability in the hierarchy of the worlds, is led into the visible temple, built above ground, by the Yoganāla, the funnel shaped tube with its wider opening at the bottom.⁵³

The symbols of the Ādhāra, the support, refer to these worlds of existence and not to that world which is beyond manifestation above the golden disc of the Sun immured in the Fire Altar.⁵⁴

The Ādhāraśilā occupies the central place in the site which will be covered

⁴⁸ The Svayamātrṇṇā, or self-perforated stones (Ś.B. VIII. 7. 3. 13; 19; VIII. 7. 4. 1.), are placed in this vertical sequence: the first on the golden man in the centre of the bottom layer, the second in the centre of the third layer, the third upon the centre of the completed fifth layer. They represent the 3 worlds, the holes being intended to afford to the sacrificer (represented by the golden man) a passage to the highest regions; SBE. Vol. XLI, p. 155.

⁴⁹ In the Pīṭha-pūjā the Great-Yoga-base (Mahāyoga-pīṭha) is realized as consisting in vertical sequence of Ādhāra-Śakti, Mūlaprakṛti, Ādikūrma, Ādivarāha and Ananta.

⁵⁰ Any unit laid down in the Agni is called a brick (iṣṭakā). The 5 'iṣṭakās' of the first 'cit' or layer are given in Ś.B. X. 4. 3. 14.

⁵¹ 'Tantrasamuccaya', I. ch. I. 79; 'Īśānaśivagurudevapaddhati', III. ch. V. 9; 'Viṣṇu-saṃhitā', XII. 82-88.

⁵³ 'Tantrasamuccaya', I. ch. I. 80.

⁵⁴ Re. the symbol Āmalaka see Pt. VIII.

by the building of the temple⁵⁵. In the Fire Altar, this central place is the site of the navel (nābhi) of the Uttaravedi. In its own position the Ādhāraśilā is the omphalos or 'nābhi' of the temple which is the concrete form (mūrti) of universal manifestation.⁵⁶

In certain instances both the rites are performed, the rite of the Ādhāraśilā, the stone support, and the rite of laying the first bricks. The stone foundation rite is enacted separately : in the following night the laying of the first bricks, south of the main door takes place ('Tantrasamuccaya', I. ch. I. 81-82). The all important deposition of the Garbha, the Seed and Germ of the temple, is made above the first bricks on varying levels, according to the status of the donor of the temple.⁵⁷

That the name of the First Brick, Ādyeṣṭakā or Prathameṣṭakā is extended also to the first stone, etc. shows the rite of depositing the bricks to be the more comprehensive one. In this way, the foundation rite of a temple, built of any substance can be performed as Iṣṭakā-nyāsa. When the Śilānyāsa is performed as Iṣṭakā-nyāsa, when the first stones are laid alike to the first bricks, a stone jar is deposited in the centre and the stones are laid in the corners of the square with the invocation which is that of the Earth in its fulness, and of the bricks ; "O Nandā, O Vāsiṣṭhā, gladden with wealth and progeny ; O Jayā, bearer of victory, O goddess, bring thou victory. O Pūrṇā, thou fulfilled one, daughter of Aṅgiras, make me one with all desires fulfilled ; O Bhadrā, daughter of Kāśyapa render my mind gentle. O ye, endowed with all seeds, full of all gems and plants, Rucirā, Nandanā, Nandā, Vāsiṣṭhā, take your pleasure here. O divine daughter of Prajāpati, thou square one (caturaśra)⁵⁸ and handsome in all parts, Mahīmāyā, Subhagā, Suvratā, Bhadrā, Kāśyapī, take your pleasure in this building. O Bhārgavi, honoured by great teachers (ācārya), decorated with perfumes and garlands, benefactress of the world, take your pleasure in this building. O thou Perfect one, perfectly proportioned, with beautiful eyes, daughter of Aṅgiras, bestow (on us) the desired (blessings). I now instal thee (pratiṣṭhā)" ('Viṣṇudharmottara', Pt. II. ch. XXIX. 84-89)⁵⁹. With many names and as

⁵⁵ The proportions of the several parts of the Ādhāra are derived from the height of the pillar of the temple, according to 'Tantrasamuccaya', II. XII. 3, and 'Śilparatna', X. 6-13. In the later text, the added height of Kalaśa, Padma, Kūrma and Yoganāla (jar, lotus, tortoise and tube) would be below one-half of the height of the pillar of the temple to be built ; and the whole Pīṭha, according to ib. X. 7, would be about three quarters of the height of the pillar of the building.

⁵⁶ The square Ādhāraśilā has a depression in its centre ('Tantrasamuccaya' I. I. 74) wherein grain is deposited and on it the Nidhikalaśa, the treasure jar.

The place of the Ādhāraśilā should thus lie along the vertical axis which is laid through the centre of the Brahmasthāna. There, Brahmā is beheld on the navel-cord (nābhi-sūtra) of Vastu-puruṣa [Viṣṇu-Nārāyaṇa] ('Kāśyapaśilpa', II. 24).

⁵⁷ According to 'Mayamata', XII. 104, the First Bricks should have a width equal to that of the Garbha, and should be twice as long and half as thick (cf. note 28).

⁵⁸ 'Caturagra', in the text.

⁵⁹ There are variations in the mantra, in the different versions. 'Hayaśirṣapañcarātra', XII. 290-294 ; 'Bṛhat Saṃhitā', LII. 112 ; 'Vāj. S.', XX. 9. XI. 44. (Kāṇva recension). The first śloka of this mantra is the invocation of the Earth in the rite of Garbhādhāna ; cf. 'Īśānaśiva-gurūdevapaddhati', III. ch. XXVII, and 'Viṣṇusaṃhitā', XIII. 43 f., in slightly different versions. It is omitted from the 'Viṣṇudharmottara'.

daughter of Prajāpati,⁶⁰ the lord of creation, and as square, Earth, the goddess in her wealth and perfection, is invoked in this rite of placing the first stones. There is no vertical symbolism of the centre here as that of the Fire altar or of the Adhāraśilā of the temple and of the Pīṭha-pūjā.

Stone, as a substitute for brick shares in its rites; they differ from the vertical symbolism of its own rite of installation in the centre of the pit of the temple corresponding to the centre of the Vedic altar. The symbolism in the vertical of this foundation is understood in the Hindu temple as the realm of Śakti and Viṣṇu, the seat of the supporting Energy and Stability below the level of the temple as Puruṣa. Stone takes its place in the tradition; it is in the very centre of the sacred site.

Stone, declares the 'Mayamata' (XV. 78) should be used for temples and is allowed to Brāhmaṇas, Kṣatriyas and heretics (pāṣaṇḍin) but one should not use it for Vaiśyas, and Śūdras. Once more (XXV. 186-87), the 'Mayamata' says: stone or wood are fit for gods, Brāhmaṇas, kings and hermits (āśramin); stone is not fit for Vaiśyas and Śūdras.

The particular position of stone in the foundation rite has its prototype in the position of the central substances in the Vedic Agni, such as the Svayamātrṇṇā "bricks", themselves of stone.

Apart from this, hermits and ascetics had chosen stone and rocks for their retreat ('Arthaśāstra', XIII. 2). Heretics, such as the Buddhists and Jains enlarged and embellished those retreats into rock cut monasteries and temples. The Hindus too carved and hollowed the living rock into cave temples though with some reticence, the earliest cave sanctuary, in Udayagiri in Central India dates from about 400 A.D. only. The 'Viṣṇudharmottara' refers to the installation of images particularly in caves.⁶¹ Of rock cut temples the later texts have but little to say.

Stone, when quarried and cut is an enduring and noble material, fit for gods, priests and the ruling classes. It is "100 times more meritorious to give a brick temple than a thatched temple; 10,000 times more meritorious to give a stone than a brick temple" ('Mahānirvāṇa Tantra', XIII. 24, 25). The 'Mayamata' makes stone beyond the reach of the lower castes. The attitude of the 'Viṣṇudharmottara' is different. White stones are assigned there to the Brāhmaṇas, red ones to the Kṣatriyas, yellow to the Vaiśyas and black ones to the Śūdras (Pt. III. ch. XC. 2), in exact imitation of the colour of the soil as it is fit for the respective castes.

⁶⁰ Kāśyapa is Prajāpati; Vasiṣṭha, Bhṛgu and Aṅgiras are Prajāpatīs.

⁶¹ A legend tells of the connection of sacred cave and temple, although in this particular instance the reference is to a structural and not to a rock cut shrine, the Kapoteśvara temple at Chezarla, built about 400 A.D., in the Guntur District, Madras. It is an apsidal, barrel vaulted, brick structure, re-decorated in the eighth century and still standing. (Coomaraswamy, HIIA, Fig. 147).

The legend tells of Yogīs who performed austerities in the local caves at Devarakonda and how these Yogīs were transformed into Liṅgas by the power of their austerities. Rāja Śivi of Kashmir who had come there and was giving up his life for a dove was also transformed into a Liṅga. The Brāhmaṇas erected a temple there and named the Liṅga Kapoteśvara, the Dove-Lord, as Śivi had given up his life for a dove (A Rea, 'Report, Southern Circle', G. O. No. 382, 1889; 'ASI., Southern Circle', Report 1917-18, p. 34).

Accordingly also, white clay should be used for bricks for Brāhmaṇas and so on (ib. Pt. III. ch. XCI. 1).

Stone as part of the earth shares in the rites due to it; building stones however are quarried, taken from the earth by force, they have been rent from their living context like the trees which are felled for their wood. So the Sthapati and astrologer go to the quarry or to the forest and propitiate in the same manner the spirits who live in stones, all the gods, Yakṣas, Vidyādhara, Rākṣasas, Piśācas, Nāgas, Gandharvas and the eighteen Gaṇas" ('Vaikhānasāgama', X.), and those who live in the trees ('Viṣṇudharmottara', Part III. ch. LXXXIX. 13 f) with the request to change their abode and depart quickly ('Vaikhānasāgama', ch. X.). With similar words, and also with offerings, the spirits who reside in the soil are requested to leave before building is begun ('Br̥hat Saṃhitā', LVIII. 9-11; 'Īśānaśivagurudevapaddhati', III. ch. XXVI. 73-74). This is done whenever a part of this earth is taken possession of and converted by the art of man into the residence of his God.

"Let goblins, godlings and gnomes (guhyaka) depart, O tree, may Soma, the Moon, grant you further strength. Luck to you, sons of the earth, gods, and gnomes. I shall do this work (so please) change your habitations." This incantation precedes the felling of the tree in the 'Mayamata' (XV. 89-90). At this moment the 'Bhaviṣya Purāṇa' (CXXXI. 33) addresses the tree directly as 'God of gods', after having consoled the tree: "O tree, go to the temple of the gods for the benefit of all the tree world. There you shall remain safe from the wood cutter's axe and from fire". "You will obtain the position of a God and people will worship you" (ib. 27-29). Then the tree is brought to the workshed and kept there for six months ('Mayamata', XV. 103-104). The wounds made by the axe are healed by the honey of the words and by the honey which has also been smeared on the axe (V.D. Pt. II. ch. XXIX. 48-49). Magical knowledge is combined with practical experience which requires that the wood of the tree should be seasoned so as to be fit for building and carving. Correspondingly, various tests are applied to the stone before it is quarried by which its suitability for building temples and making images becomes known.

Stone, severed from the rock, taken from its site, is transformed in its nature, alike to the wood, when it becomes the substance of which the temple is built, imbued as are the bricks, with its indwelling Essence. The single courses of the stones of the temple have the height of the respective mouldings, reglets, etc.

Stone, in its natural site, the living rock, is also made to hold sanctuaries and to simulate stupendous temples, such as the Kailāsanātha Temple at Elura (Hyderabad) of the eighth century and the smaller, rock cut shrines of different types at Mamallapuram (near Madras) in the seventh century and at Kalugumalai (Tinnevely District, in the extreme south of India) in the eleventh century, at a time when the rock cut Buddhist Caitya halls and Vihāras had fulfilled their purpose and evolution and the Jain excavations (Indra Sabhā at Elura) had kept pace with the rock cutting activities of Buddhists and Hindus.

But for a brief mention of the caves where, particularly installations should be made "for the denizens of heaven are present at these places" ('Viṣṇudharmottara', III. XCIII. 27-28), Vāstuśāstra designates these secret (guhā) places as Layana, when they are rock-cut temples ('Samarāṅgaṇasūtradhāra', LIX. 236). These, in their transformation by art, are stations of a 'return to nature' symbolic

STONE

of man's return to his original state and higher Self; the devotee enters them as places of release equal to the structural temples with their transubstantiated walls. The cutting and entry into the living rock would thus re-instate man in that integrity from which he had departed and fallen since the Kṛta Yuga, the Perfect age, when he lived in the hills at peace with himself.

WOOD

The death of the tree, clay or stone is effected in darkness⁶², the tree has to be felled in the evening ('Viṣṇudharmottara', III. ch. LXXXIX. 13-15) and when the night draws towards dawn, the spirits of the soil leave the field which is to be converted into the site of the temple ('Īśānaśivagurudevapaddhati', III. ch. XXVI. 74 f).

Having been made dead to their natural selves, with the spirits who animated them once departed for good, clay, stone and wood are freed from their former associations. These were specially felt by the ancients in front of the trees for man and tree are closely connected in their life and fate. Not only in Paradise does a tree play its part in the fall of man; the Purāṇas, 'Brahmāṇḍa' and 'Vāyu', tell the story of the fall of man, through the ages, after the Kṛta Yuga, the Perfect age, from the Tretā Yuga, when trees appeared for the first time and housed mankind.⁶³

In the Kṛta Yuga, people lived on mountains or on the sea-side. They had no houses and no grief. They moved about freely, glad at heart and none hurt the other for they had what they wanted. They achieved their desires by thinking about them. Whatever they desired came out of the surface of the earth. In the course of time, however, they diminished in inner stature and grew out of this age of wisdom and contemplation; this process brought them into the Tretā Yuga. Now their decreased thought-power was made up by the first rain that fell and it was compensated by the trees which now appeared and whence they obtained all kinds of enjoyments and useful things. The trees were called "houses" (grha) and they were like houses. There the people lived without effort and without want; yet passion and greed (rāga-lobha; 'Vāyu Purāṇa') arose in them and the house-tree vanished. Then only did the people begin to think again and once more the trees sprung up. Again the people became greedy seizing even the trees for themselves; in response to their greed and its satisfaction, the other pairs of opposites also came into existence, scorching heat and piercing cold, etc. Now men were compelled from outside to protect themselves even further and they began to build houses, exactly like the trees, but in their own measure.

Units of measurement, such as the width or digit of the finger or cubit (aṅgula, hasta, etc.) came into use from that time and the houses retained what had belonged to the trees, the 'branches' (śākhā) and the name.⁶⁴ In this story of man's fall

⁶² R. Guénon, 'De la Mort Initiatique', Ê.T. 1934, p. 174; "Every change of state is accomplished in darkness".

⁶³ The following is a resumé of the version of the 'Brahmāṇḍa Purāṇa', I. ch. VII. 46-83. The account of the 'Vāyu Purāṇa' ch. XLV. 11-50 differs in details.

⁶⁴ The account winds up with a popular etymology,—deriving the word 'śālā', hall, from 'śākhā', branch. Śākhā is however the name for door-jamb ('Bṛhat Saṃhitā', LII. 26. comm.)—and with a happy end saying that as the people felt happy in the big buildings, these were called Prāsāda. This popular etymology of Prāsāda is also given in the 'Īśānaśivagurudevapaddhati', III. ch. XXVIII. 1-2. "Prāsādas please (prasīdanti)", and copied from there, in

from the Principle and of his degradation since the Perfect age, the house-tree springs up in compensation for his falling knowledge and thought power. It is a 'tree of knowledge' in which man then dwelt. From that time, too, measure originated resulting from division. In this divided world, divided by the dual and distinct knowledge of the contraries or pairs of opposites, men dwell in houses which preserve in their name, the memory of trees, their prototype.

The 'Mārkaṇḍeya Purāṇa' (XLIX. 24-30) describes the fall of man succinctly : In the Tretā Yuga men fell from heaven. Those wish-fulfilling (kalpa) trees, were produced, commonly called 'houses' (gr̥ha)⁶⁵.

The wish-fulfilling tree, a concomitant of the fall of man is the tree of knowledge; it witnesses and holds his fall; it is the prototype of the 'house' in which man dwells. Beheld 'historically', the appearance of the house-trees is subsequent to the down-coming of the Vāstupuruṣa, which took place towards the end of the Kṛta Yuga and was complete in the Tretā Yuga. The earth then was steadied and levelled, the plan laid out of the house on earth and the residence which Yama, Death, grants to men.

Wood has primacy in the building of houses; brick, in the piling up of sacrificial monuments. Brick belongs to man, the sacrificer, in his effort at reconstruction and winning back a wholeness of which he knows himself as part or token. Wood is known by him as a symbol of that wholeness. He clings to it during his fall.

In the Rgveda the question is asked : "Which was the wood, which the tree from which they (the gods) shaped⁶⁶ heaven and earth"? (RV. X. 81. 4). "Brahman was the wood, Brahman the tree from which they shaped heaven and earth" is the answer in the 'Taittirīya Brāhmaṇa' (II. 8. 9. 6). The Supreme (parā)⁶⁷ meaning of wood is Brahman, who is the operative and immanent cause of the universe, because of making himself so and by modifying himself into this universe ('Vedānta Sūtra', I. 4. 25)⁶⁸. While modifying himself in the universe, the Great

the 'Śilparatna', XVI. 1. The true etymology and meaning of Prāsāda however is also given in the 'Īśānaśivagurudevapaddhati', III. ch. XII. 16; JISOA, vol. X. p. 225, see Part V.

Re tree-houses, see for example an Urali tree house; 'Travancore Information', vol. I. No. 7, p. 75; or supported on one stem, like the top of a tree, the type of the Mot-Cot at Hanoi; Coomaraswamy, 'Early Indian Architecture', 'Eastern Art', vol. III. Pl. CII. Fig. 36; connected with them is also the Diwan-i-khas with its central pillar in Fatehpur Sikri (1570-80). The single pillar there supports the place for the throne on which Akbar sat; cf. also the 'eka-tthūnaka' and 'eka-tthambaka pāsāda' of the Jātakas, Coomaraswamy, l. c.

⁶⁵ Akin to this is the Kalpadruma, produced as one of the 14 gems at the Churning of the Ocean. It is understood as the 'mind which gives everything for the mere thought'. Full of such wishing trees is the Elysian land of Uttara-Kuru ('Mahābhārata', Bhīṣma parva; 'Rāmāyaṇa', Kiṣkindhā kāṇḍa; cf. V.S. Agrawala, 'The Kalpavṛkṣa motif in art and literature', JISOA, Vol. XI. pp. 1-8). The wishing tree grows close to the primordial perfection and when it is no more. It is a shoot, but not the whole of the world tree.

⁶⁶ The word here used is 'takṣ', to cut off, with a carpenter's axe.

⁶⁷ The physical, subtle and supreme aspects (sthūla; sūkṣma, parā) belong to the substance prior to its employment in the work of art and are re-affirmed by the use to which it is put by the craftsman.

⁶⁸ "This modification does not conflict with the idea of Brahman being eternally unchangeable".

Being is in the midst of it. The Skambha Hymn of the Atharvaveda (X. 7. 1-3) says: "Skambha bears these three worlds, the earth and the sky; Skambha bears the wide atmosphere, Skambha bears the six vast regions and has pervaded this entire universe". The Skambha is "the Great Being in the midst of the world" "to whom all the gods are joined as the branches around the trunk of the tree." In the same sense a twelfth century inscription⁶⁹ says of a high temple of Pradyumneśvara that it is like to the trunk (of a tree) whose branches are the cardinal regions and which is placed in the middle of the great Ocean (of air which is held above us) by the vault of heaven. It is the sole pillar upholding the House of the Three worlds. In this its supreme aspect, wood is the substance of the principal Essence.⁷⁰ This world tree is the tree of life. Its stem passes through the centre of all life, of every state of being; from it they ramify; at the top of this tree is the sun, its fruit. In this tree all the birds make their nest as man did when he still lived near the age of Truth, the Perfect age, the Satya or Kṛta Yuga, when the tree witnesses his gradual estrangement and still supports him as tree of knowledge.

Wood which has in the Skambha its prototype, makes construction easy; it serves as support and cover; its employment is the building which admits space in its interior or encloses space, and not the compact monument. Wooden temples, as represented in the carvings of Barhut, about 100 B.C. and as described in the 'Samarāṅgaṇasūtradhāra' (ch. XLIX), after 1000 A.D., are 'hall temples'; pillars support their roofs or ceilings. (see Pt. VII). The bulk of the timber on the other hand lends itself to being carved, to being cut into. Accordingly the temple is an image of the macrocosm, as shaped from that primordial wood which is Brahman.⁷¹ The open pillared wooden temple having no walls has also no compact bulk; like a sculpture intricately undercut and carved in the round it is as if taken from the wood of the World Tree. Congenital with this vision is the practice of cutting temples and other buildings and sculptures out of the living rock. The living rock in its substance is likened to the bulk of that wood.

The priority of evolved wooden forms to other highly complex types of constructive building in Indian architecture is common knowledge.⁷² The most natural wooden form is the arch, particularly of light woods, such as bamboo, bushes and branches; distinct from brick and stone, the wood of bamboo grasses and of branches is pliable. While the heavy wooden log or the stem of the tree

⁶⁹ Deopara inscription of Vijayasena, 'Ep. Ind.' vol. I., extracts following the translation by P. Mus, op. cit., BEFEO. XXXII. p. 413.

⁷⁰ It is as All-pervading Tree, that the tree is worshipped as god of gods, used as substance for the images of gods ('Bhaviṣya Purāṇa', CXXXI. 33) before the special tree is felled for the carving of the image. The timber is then brought to the workshop and allowed to become seasoned during 8, 5 or 3 months according to the variety which is used ('Īśānapaddhati', IV. XXXIII. 34).

⁷¹ RV. I. 20. 2. The work of the Rbhus, the artists of the gods, is compared with that of a carpenter, Takṣaka (from the root 'takṣ') ; they unite mind (manas) and word (vāk),—either of them hewn out of the Brahman-wood.

⁷² The scarf jointing of the coping and the tenons of the uprights of the stone railings set up by Buddhist and Jains in the centuries before and after the beginning of the Christian era. Pañjara, the 'cage' originally of plaited bamboo strips, remains a technical term for a miniature shape of a building (anukāya) in brick architecture and stone bonding (Part VII).

furnishes the supreme aspect of the substance wood, the arch is symbolic of its subtle aspect.

When a person had died and was cremated, the 'Āpastamba Śrauta Sūtra', XXXI. 2. 36, prescribes that two branches of Palāśa or Samī wood are fixed in the ground, to the west of the cremation site; at the top, the two branches are tied together with a string of Darbha grass. Under this arch, the relatives of the dead person pass from South to North, from the realm of death to that of men. They return to life, purified by having passed beneath the arch, the purifying (pavitra) arch of god Savitar, the Sun, extended thousand rayed in space.⁷³

The subtle aspect of wood is the arch. Bamboo and branches bend naturally. Heavy logs of wood were bent artificially while being steamed to yield similar curves. Finally, the form of the arch is cut in brick and stone. Moreover, the entire superstructure of the temple, the Śikhara, has the curves of bending bamboo, or other light woods, etc. in most of the Hindu temples.

The stem of the tree on the other hand, the wooden post,—with the exception of rock-cut pillars,—has remained at all times the primary support of the buildings. The stone or brick pillars of the temples have incorporated into their bulk the proportions of their wooden prototypes. They are either equal to them in measure, or their width is increased proportionately to one and a half or twice that of their wooden prototypes. ('Śilparatna', XXI. 118).

Brick, made of earth which has gone through the fire, is the substance in which is reconstituted the body of Prajāpati-Agni; it is at the same time the sacrificial body of man, the sacrificer. Stone has its place at the navel of the earth, at the centre and basis of monumental building activity. Wood in two ways adds its 'immortal' form: the trunk of the tree, support and substance of the universe, the manifest Brahman, and the arch, through which man returns from the darkness of death to life in its radiance and is reminded of his principal state which is that of 'mokṣa', release from life, when he is united to the principle and at one with himself.

Altogether these, earth and clay, brick, stone and wood are Prakṛti which is the substance of the temple, in relation to its Essence and meaning, the Puruṣa. His likeness had been forecast in the lay-out of the Vāstupuruṣamaṇḍala.

⁷³ The arch of the 'form of nature' (prakṛti) is there so that one may pass through it, surrounded by its glory. Gopinath Rao, 'Elements of Hindu Iconography', Pt. I. vol. II, p. 248, quotes a Tamil work, the 'Tiru-arul-Payan' (ch. IX. 3) which explains the Tiruvāṣi, the arch or halo (prabhāmaṇḍala) as the encircling "dance of nature (prakṛti) contrasted with Śiva's dance of wisdom (jñāna)."

The symbolism of constructed buildings, in the vertical direction, is one of ascent and also of support. The world tree with root above and branches below ('Bhagavad-Gītā', XV. 1), descending from that root, the Para-Brahman, does not give its 'inverted grained' wood for the symbolical substance of the temple. This tree leads back all Knowledge to its root; the World tree from which the temple is cut out is an image of manifestation, its wood when felled is the timber for the construction of the temple. The tree is always the same but the viewpoint varies with the level of the beholder. An article on 'The World Tree' by Śrī Swāmi Hariharānand Saraswatī, JISOA, vol. XI, pp. 196-207, explains the meaning of the "Tree with its Root Above".

THE HINDU TEMPLE

Before the work is begun, the axe, the line, the hammers and all the other instruments are worshipped with incense, flowers and unhusked rice ('Viṣṇu-dharmottara', Pt. III, ch. XC, 29; 'Samarāṅgaṇasūtradhāra', XXXVII. 28). This makes them fit to perform the task in the hands of the competent craftsmen ready for the inspired moment of action.

PLASTER

Whether an Indian temple is built of wood, brick or stone, the work is done with precision. Bricks and stone are carefully laid and joined (*suyuktyā*; 'Viṣṇudharmottara', III, ch. XCI, 12). The stones are frequently kept in position without any cementing material.⁷⁴ Iron clamps are used for wooden joints, if need be and where the masonry is dry the stone blocks are held together with iron dowels (Deogarh). *Sudhāśilā*, plaster, and *Vajralepa*, a glue cement and coating, were applied; there is no lack of prescriptions how to prepare them. *Vajralepa* is a hardened glue mixed with other substances such as conch shell powder or white earth (*caolin*). *Vajralepa* is made either of purely vegetable substances, gums, resins, and viscous residues, or else it is produced from animal substances, hides and horns; to the latter could be added a mixture of metallic substances, or of lime. *Vajralepa* which means 'diamond plaster' is so called because it is specially durable and firm; it is recommended for these qualities, in the 'Śilparatna' (XIV. 58-75), in a passage which deals with the different kinds of lime plaster (*sudhā*). The careful process of mixing the several ingredients with the granulated and powdered lime from gravel and conch shell lasted from two to four months with the result that the plaster was not only durable but also that it had none of the stark deadness of effect which for instance whitewash imparts. It is a rich and creamy white, discreetly shining, like polished ivory or some ancient enamel.⁷⁵ Under this white, smooth, polished plaster, stone and

⁷⁴ The practice of building with cyclopean stones (cf. *Jarasandha-ka-baithak*, Rajgir) (Kramrisch, in Vol. VI, p. 235 of Springer's 'Kunstgeschichte') persisted in the Hindu temple: in the courses of dry masonry of carefully dressed and relatively very large stones (Gupta temples in Central India; early *Cālūkyā* temples in the Deccan, early Cola temples in South India). In the *Cālūkyā* temples, dry masonry, with no cementing materials between the stones, was employed in the earlier sandstone buildings (H. Cousens, 'The *Cālūkyā* Architecture', *ASI. NIS. Vol. XLII*). This is also true of the mediaeval temples of the Deccan built of amygdaloidal trap (H. Cousens, 'Mediaeval Temples of the Dakhan', *ASI. IS. Vol. XLVIII*), of those in Gujerat (J. Burgess-H. Cousens, 'Architectural Antiquities of Northern Gujerat', *ASWT. Vol. IX*), and of Orissa (M. M. Ganguli, 'Orissa and Her Remains', p. 257).

Metal has been used for bonding from the Mauryan pillars onwards (bronze dowels or copper cramps). Wrought iron beams form a grid as framework for the stone masonry of the ceiling of the *Maṇḍapam* at Konarak, Orissa, in the 13th century.

⁷⁵ Some of the most perfect temples in Central India, at *Khajuraho*, have their facing stones of fine sandstone embedded in lac (*lakh*), apparently resinous *Vajralepa*; *chunam* concrete being generally used in the core. Iron clamps are also freely employed; (B. L. Dhama, 'A Guide to *Khajuraho*', p. 4). In the Panjab the *Kafirkot* stone temples are cemented with lime mixed with quartz (Cunningham, *ASI. Vol. XIV*, p. 26).

The earliest preserved dry masonry is the stone facing of *Stūpa I*, *Sāñcī*; the earliest occurrence of lime mortar in historical times is in the brick foundation of the *Viṣṇu* temple at *Besnagar* (*ASIAR*, 1913-14). Brick temples have frequently a thin layer of a clay mixture as an adherent between the bricks (P. Brown, 'Indian Architecture', Pt. I, p. 16). The brick temples in *Sirpur*, C. P., seventh century, were completely covered by a thin layer of white plaster. The bricks are carved (*ASIAR*, 1909-10, p. 11).

The '*Bṛhat Saṃhitā*' Ch. LVI, 1-3, 5-8, and the '*Viṣṇudharmottara*', Pt. III, Ch. XCII,

brick are often combined in one and the same structure, stone in the lower parts and brick above, a practice found not only in South Indian temples, but also in

1-15, among the 'early' texts, give the ingredients of the various kinds of Vajralepa which were used in stone and brick buildings. Vajralepa formed also the ground for wall paintings; this is described in detail in the 'Mānasollāsa' or 'Abhilāṣitārtha Cintāmaṇi', a compendium compiled in the twelfth century.

Four and five recipes respectively of the preparation and ingredients of Vajralepa are given in the 'Bṛhat Saṃhitā' and in the 'Viṣṇudharmottara'. Two of the preparations are purely vegetable, one consists of animalic glue and vegetable substance, the fourth contains metallic substances and into the fifth (V. Dh. 1.c., 10-11) a concoction from cowhides, etc., and lime has been mixed.

These different kinds of Vajralepa, the 'adamantine glue', are used for external application, on stone and brick buildings, according to both the early texts. V. Dh. ib., 12-13, indicates that these mixtures are also used for cementing the stones or burnt bricks of the buildings.

In the 'Mānasollāsa', II, iii, 1, 132-40 (Cf. also the 'Nārada Śilpa Śāstra' of which two chapters on painting are translated by V. Raghavan, *JISOA*, Vol. III, p. 19 f.), the walls, to which lime plaster (*sudhā*) has been applied should then be coated with a paste of hide-glue mixed with white earth (kaolin ?) in three layers, and above it another final coat of the same paste mixed with powdered conch, etc. This passage clearly shows that the 'adamantine glue coating' or 'plaster' the Vajralepa, is applied in several thin coats above the lime plaster, *Sudhā*. The final coat of Vajralepa, when completely dry, forms the ground of wall paintings. The 'Mānasollāsa' describes as further use of the Vajralepa that it is mixed with all colours. In that case, the glue of the boiled buffalo skin is collected on small sticks and allowed to harden. It is then put in an earthen pot with water and melted. This pure glue is to be mixed with the respective pigments. It is thus a tempered medium for painting on the Vajralepa-ground (the reference in V. Dh. III, Ch. XL, to a decoction of hides, may imply this too).

The wall paintings, according to the 'Viṣṇudharmottara', 1. c., are executed on plaster. The plaster there, in the main, consists of bricks, variously powdered, mixed with clay and carefully prepared with gum resin, bees wax, liquorice, molasses, 'mudga' bean and other vegetable substances. Sand, etc., has to be added in due proportion; the mixture is allowed to consolidate for one month, and is then applied to the wall and left to dry. If this dry plaster is not perfectly smooth, it is coated with clay plaster mixed with resin and oil which is carefully smoothed and polished. On this dry, smooth wall the paintings are produced acc. to Ch. XL, Pt. III, of the 'Viṣṇudharmottara'.

The kinds of glue Vajralepa, given ib., Ch. XCII, are not referred to in connection with the preparation of the ground of the wall paintings which is a brick and clay plaster with a certain amount of resinous and viscous substances in its fabric.

The 'Śilparatna', XIV, 58-75, describes different kinds of lime plaster, mainly from powdered, etc., gravel but also of powdered shell and with a proportion of sand to which the following liquids are added: the sap of various milky trees, *Aśvattha*, *Butea Frondosa*, *Kadamba*, *Myrobalan* and *Mango-juice*, or curd, milk, cocoanut water, ghee, as well as ripe bananas, pulse, rice gruel, etc., according to the different types or desired qualities of the plaster. Last of these varieties of plaster, Vajralepa is described. 100 parts are lime, 2 parts resin (*karala*), and small quantities of ghee, bananas, cocoanut-water, pulse, *Aśvattha* sap and jaggery. Re. Vajralepa, a buffalo hide glue, see Ch. on Painting, ib. XLVI. 131-2.

Vajralepa acc. to the 'Śilparatna' XIV, 75, is a high grade lime plaster with two per cent. resin in its composition, and other binding and adhesive substance. The term Vajralepa denotes a special kind of plaster used in buildings; in wall paintings however it is a glue-coating and glue medium (see above, and " 'Śilparatna', Ch. 64", *Trans. Coomaraswamy*; cf. *infra*).

Coomaraswamy, 'Indian Architectural Terms', *JAOS*, Vol. 48, p. 263, says of Vajralepa, the adamantine medium, that it is actually glue. It should be distinguished from *Sudhā*, plaster. This is correct, but when various glue-substances are mixed with the plaster, the whole mixture is also called Vajralepa.

the Deccan as in the Temple at Kokamthan, Ahmednagar.⁷⁶ On the superstructure of this temple the fig. e-symbols are cut or formed in the plaster only, while the carvings on the Kailāṇātha Temple at Conjeeveram are of stone with their ornaments and lesser details carved in plaster.⁷⁷ The calm radiance of the white temples is extolled in inscriptions.⁷⁸ In this whiteness, it appears, their 'sāttvika' quality, their conformity with the pure Essence (sat), shone forth.⁷⁹ This luminous splendour corresponds to the ascending tendency within the 'sattva guṇa', which is expressed by the vertical of the high superstructure of the temples and the total disposition of their mass. From the broad base they are built up towards the high point in the centre above even their mountainous superstructure or Sikhara.

Bricks and stone are frequently combined in one and the same building. The body of the temple is of brick and the door frame of stone,⁸⁰ or the body of the temple is of stone and the superstructure of brick,⁸¹ or in a single architectural relief panel, the major part is stone and it is completed in brick on one side.⁸² These varied combinations, for reasons of added strength or decreased weight or for the sake of expediency, are due to the relation of the craftsman to his work and towards the means of making it. Once he has taken the stone for instance from

Various recipes for producing an 'adamantine plaster' were used in the millennium, from the 'Bṛhat Saṃhitā' and 'Viṣṇudharmottara' to the 'Śilparatna' in different parts of India. Lime plaster particularly described in the 'Śilparatna', the 'Mānasollāsa', and the 'Īśānaśivagurudevapaddhati', IV, Ch. XXXIII, 66-69,—'Vajrabaddha', an adamantine plaster used as ground for paintings,—South Indian text books, is also briefly mentioned in 'V. Dh.' III, Ch. XCI, 15, as Sudhāśilā, where its use is advised in temples, but not in houses. The same chapter (14) speaks of Vajralepa which is described in detail in the following chapter, as cementing material for baked bricks and stones, whereas mud cement is prescribed for unbaked bricks. Re. plaster, cement and the ground of wall paintings, see also 'Mayamata', XVIII, 92—115.

⁷⁶ Cousens, 'Mediaeval Temples of the Dakhan', op. cit., p. 50. The walls are of stone, the Sikhara or superstructure is of brick. The carvings in stone are overlaid with plaster; in the brick portion, the carving is solely in plaster.

⁷⁷ Carving in plaster, and also in terracotta gives precision and dignity to these substances; cf. the carved bricks of brick temples from the Gupta Age (Deogarh, Paharpur, etc.) to those of the nineteenth century in Bengal.

⁷⁸ "The temple resembling a mountain shines white." Mandasor (in Lāṭa) Inscr., A.D. 473-74, line 16, 'Indian Antiquary', Vol. XV, p. 196. This temple was consecrated to Sūrya.

An inscription from the Lakṣmaṇa Temple, Khajuraho, dated in the Vikrama year 1011, or 954 A.D., praises this temple in verse 42 as a "charming, splendid house of Viṣṇu which rivals the peaks of the mountains of snow"; 'Epigraphia Indica', Vol. I, p. 121.—An inscription of the early 13th century speaks of repairs to all the temples in the city. They were also made resplendent by being newly plastered. Chebrolu Inscription, Kistna District, 'Ep. Ind.' Vol. V, p. 149.

⁷⁹ The 3 Guṇas are Sattva, Rajas and Tamas. Their colours are white, red and black, and their inherent tendencies are ascending, expanding and descending, respectively. The three Guṇas are the three constitutive qualities of Prakṛti, the nature of the world.

⁸⁰ Sirpur, C. P.

⁸¹ This is frequent in the later South Indian temples.

⁸² Paharpur, Bengal: ASIAR, 1926-27, Pl. XXXII a; Kramrisch, 'Indian Sculpture', p. 215.

THE HINDU TEMPLE

the earth and the tree from the forest and its living context, with expiation and apology for his interference, he takes on himself the responsibility for giving them appropriate use in the new context. This is to set up the temple as an image of the Puruṣa and as His dwelling. The natural connection has been severed, the earth has been burnt, the stone has been cut, the tree has been felled and they arise as the temple and its parts. Their texture survives and it is given consideration by the traditional and hereditary craftsman. It would, however, amount to a retrogression from the state of grace into the state of nature were one to expect that the 'material' would guide the builder. On the contrary, brick and stone alike, or in combination, may disappear under a coating of plaster, which might partly have been coloured too.⁸³

The 'material' does not demand from the Hindu craftsman in his treatment of it a consideration of its nature for it has ceased to exist as such. The wood of a living tree fulfils a different function from that of a carved image, pillar or vaulted beam. It has been converted to its new function by a series of processes, by art as well as by magic. As little as Indian thought knows of 'matter' so little is the craftsman concerned with the material for the sake of its effectiveness. He knows, on the other hand, its texture and the various qualities which make it suitable for one special purpose and not for another. He does justice to them and applies his knowledge and sensibility to the lustrous malleable metals for instance or to the stones of different hardness and light-absorbing power in their carved surfaces. These qualities act as evocative influences by the contact with his hand and eye and they make more close his identification, by his work, with his vision. It is in the form of his work and its intense consistency. This does not belong to any single statue or image only, for all the carved form, figure or architectural unit, however small, is part of a comprehensive whole, the temple. It may show itself as made of wood, brick or stone or else be covered by a coat of egg-shell like plaster and painted detail. Sometimes, as in the Kailāsanātha Temple at Conjeeveram, the detail is carved only in the thick plaster which overlays the stone, such embellishment far from being supernumerary tends to focus attention on every part to which it clings.

Stone, brick or wood and also plaster and paint are substances of realisation. In them the image or vision takes form, settles down, imbues their grain and fibre and gives them the new life, as part of the temple, the seat of God. All the same these substances are true to this name also in another sense. In them 'subsists' their grain and texture, the frame-work given to them by Yama, and it carries with it the memory of their original state. This finally outlasts its own

⁸³ To what extent each structural temple was originally plastered, or plastered and painted, is difficult to say. The cave temples of the Deccan, however, almost without exception were originally coated with plaster and painted, on their plain and straight, as much as on their carved and modelled surfaces. Ellora, especially in the Daśavatāra cave, Bādāmi and Ajaṇṭā have still painted plaster preserved on their images; especially in Ajaṇṭā, the large Bodhisattva figures in the sanctuaries of caves I and II, and on carved capitals and pillars, etc.

In temples no longer in use whatever plaster there may have been has since disappeared or perhaps never existed at all, whereas it has been overlaid by the use of whitewash in those still in worship.

PLASTER

particular substance; the curves of light woods for instance such as bamboo and branches, retain their resilience whether they are cut in brick or carved in stone.

"The clay is permanent but things constructed with the clay are not so" ('Brahmavaivarta Purāṇa', I. XXVIII. 29). The clay persists in nature, however many things made of it may perish. On the other hand, even when substances other than the clay are used, its feel, its qualities, and the ideas associated with it, persist; the form which resulted from a long and intimate contact remains a living memory and by it such other substances are shaped which are substituted for definite reasons. The clay, the brick, the wood and to some extent too the 'cyclopean' boulder of stone have each outlasted their original state and also their actual employment in the form and proportion of the temple.

The well known transfer of the construction forms of one material into the other is so caused. The curves of the bamboo for example are copied in bent wood and cut in brick and stone. In any material, it is the bending nature of bamboo stems or wooden branches, yielding the elements and the form of the arch. Whatever the material, it is made into the same form and conveys the same meaning. It is the form by which the memory of the original is made permanent.

The inherent quality, the subtle nature, of bamboo for instance, is thus restituted by giving it a permanency which its physical nature could not guarantee. This is done by art. This permanence, in art, is a quality of the form and belongs to memory. The transfer of form from the one more perishable, to the other, less perishable substance is a restitution of the 'subtle' body, of the original clay or wood. Though all things made of clay or wood might perish including clay and wood themselves their subtle nature is expressed in stone. It is the way of redemption, a relative guarantee of immortality which things constructed are able to give.

The substance of which the temple is built gives body to the indwelling Essence; from this point of view it is immaterial what it is, and it is also immaterial whether different substances are combined or the one is overlaid by the other, provided that the Essence imbues and impresses the form.

By their new destination, wood, clay, stone and plaster, etc. are transubstantiated. This comes about while they are being worked on. In this, however, they are not altogether passive, for they offer their obstacles as well as their particular facilities and these contacts are felt and remembered by the craftsman. Sensibility contributes its own share to a wider memory which comprises all those associations that have accumulated round the bricks or the wood in their traditional employment. A triple memory, that of traditional knowledge, of sensibility and of piety helps to preserve the subtle body, that is the particular quality and aptness of the several substances, severed as they are from their natural life and habitation, in a more permanent body which has but one ultimate destination.

THE 'GERM' OF THE TEMPLE

Before the temple in the likeness of the Puruṣa is constructed⁸⁴, the rite of Garbhādhāna is performed and a casket which holds the Seed and Germ of the temple is immured in its wall, to the right of the door, above the level of the First Bricks.⁸⁵

As to a woman, the ancient rite of Garbhādhāna (RV. X. 184. 1), of impregnation and steadying of the womb, is performed to the earth; she receives the seed (bija) of the building and gives substance (prakṛti) to the Germ. Garbha means germ as well as womb, and the receptacle (garbhapātra) which is deposited holds the Seed,—the causal stage whence the unmanifest becomes manifest—and is the womb of the temple which is to arise. The sacrificing priest acts as generator, the Guru who deposits the Garbha on behalf of the donor, on a night of flawless stars.

The Garbha-vessel is generally of copper, but is also described as made of gold, silver or copper.⁸⁶ Copper appears as a substitute for gold. Gold is the prime substance of which 'images' were made, the golden disc of the sun and the golden effigy of the Puruṣa in the Agni, the fire altar, and thereafter the images of gods.⁸⁷ It is a casket, raised in the folded hands of the priest towards the sky, before it is deposited ('Śilparatna', XII. 5). Its dimensions are proportionate to those of the temple. In width it measures one twelfth part of the height of the pillar or the wall proper of the temple. Its base, generally, is square and may also be circular.⁸⁸ Its own height is half of its width.⁸⁹ Its absolute size varies

⁸⁴ 'Agnipurāṇa' LXI, 11, on the 'Vairāja' form of the Prāsāda. The temple is the form of total manifestation; in its unity cosmic intelligence ('Virāj') is seen. 'Viṣṇusamhitā', XIII, 61-69; 'Śilparatna', XVI, 114.

⁸⁵ 'Īśānaśivagurudevapaddhati', III, XXVII, 72 f. Re: The seed (bija) of the Prāsāda, see note 95, the Prāsāda Mantra, Pt. V, note 22; Pt. VIII.

⁸⁶ The casket or vessel (garbhapātra, phelā) is a counterpart to the Ukhā, the fire pan, the womb of the Fire, equal in size with the embryo, Agni. The bottom part of this "earthen womb for the Agni" is this terrestrial world. Of this alone, the Garbhapātra is a symbol; the Ukhā comprised the three worlds, "this world", air and heaven (Ś.B. VI, 5. 2. 3; VI, 5.2. 22). The Ukhā is placed on the Nābhi (Ś.B. VI, 4.3.10). With regard to its position, the Nidhikalaśa on the Ādharaśilā corresponds to it. The Nidhikalaśa and the Garbhapātra are vessels of cognate origin and similar significance.

According to 'Tantrasamuccaya', Part I, Ch. I, 102, the Garbhapātra is a symbol of the entire world.

Re: gold, silver or copper, see 'Hayaśirṣapañcarātra', XII, 269, 'Kāṁikāgama', XXXI, 8-9. Re: silver, cf. also note 87.

⁸⁷ 'Matsyapurāṇa', LXVIII, 1; LXXIX, 3-4; LXXXIII, 15. Silver, however, should not be used in the worship of gods; it is associated with the Pitṛs, the Fathers (ib. XVII, 23).

⁸⁸ Square or circular, acc. to the 'Vaikhānasāgama', Ch. VIII; it is said to have the shape of a lotus, acc. to 'Hayaśirṣapañcarātra', XII, 269.

⁸⁹ The height of the cover of the casket is given in 'Kāśyapaśilpa', XXVI, 11, Ī.P. 1. c., 75, quoting the 'Mañjari'; 'Tantrasamuccaya', II, XII, 5; 'Viṣṇusamhitā', XIII, 23 f; 'Vaikhānasāgama', VIII, etc.; various proportions are given; they should conform to the rule of three ('Mañjari', 1. c.; 'Śilparatna', XII, 33).

and is classified according to several standards. These are : The number of the storeys of the building to be set up and which are given up to twelve or sixteen storeys.⁹⁰ With the number of the storeys, the height of the pillar or wall of the ground floor varies. There are moreover three grades of receptacles, the best being also the largest, one cubit (hasta) square. The square casket with a length of 8 finger widths, and half as high, made of copper, seems to have been the one generally in use. Inside, the casket is divided into compartments; like the Vāstumāṇḍala, and of varying number.⁹¹ The level at which the Garbha is deposited is highest for Brāhmaṇas, on the topmost moulding of the base and correspondingly lower for the other castes,⁹² but above the ground, for all castes⁹³ whereas the 'Viṣṇusamhitā' (XIII. 25) prescribes that the Garbha for Vaiśyas and Sūdras should be deposited below ground.

The position of the casket with reference to the castes shows the level from which the ascent towards the highest point, the apex of the temple, is undertaken; the road (mārga) for the Brāhmaṇas is shorter than that of the lower castes; in view of the total height of the temple this does not amount to much and altogether there need be no difference in the level of the Garbha deposited by the different castes. The proportions of the casket are relative to the height of the building, and to its 'pillar'. It belongs to the building for its measure is taken from it. The contents of the casket are those of the ground (bhūmi) of the temple: the divinities of the Vāstumāṇḍala reside in its compartments.⁹⁴ The latter moreover are replete with the wealth of the earth; its precious stones, gems, herbs, metals, roots and soils. These are distributed all around its Brahmasthāna. Within the

While generally the height of the casket is half its width (which is 8 aṅgulas, in the 'Śilparatna') it is also given as three quarter, or equal to the width ('Kāmikāgama', XXXI, 8-9; 'Kāśyapaśilpa', XXVI, 10). Compared with the Nidhikalaśa (p. 112) it has half its width, acc. to the 'Tantrasamuccaya', II, XII, 3-5. The 'Hayaśirṣapañcarātra', XII, 268, describes it as 12 aṅgulas wide and 4 aṅgulas high.

⁹⁰ 'Vaikhāṇasāgama', Ch. VIII, and 'Mayamata', XII, 9-10, indicate 12 sizes, 'Kāśyapaśilpa', XXVI, 9, describes the vessel of different size according to the height of the building ranging from one to sixteen storeys.

According to 'Kāśyapaśilpa', XXVI, 10, and 'Mayamata', XII, 11-12, the width of the Garbhapatra is given with reference to the diameter of the pillar (aṅghri-ṣṭkambha) as being equal to it or narrower by an aliquot part.

⁹¹ Twenty-five (and not 100: abhikṛti) according to 'Īśāna-paddhati', III, Ch. XXVII, 81; 'Mayamata', XII, 13, speaks of 9 to 25 compartments (9. 16. 25) or 3², 4², 5². The height of the walls of these compartments is given in 'Mayamata', XII, 14, and their thickness is 2, 3 or 4 Yavas.

⁹² 'I.P.', I. c., 73-74.

⁹³ 'Kāmikāgama', Ch. XXXI, 90-93. The 'Tantrasamuccaya', I. c., follows the 'Viṣṇusamhitā' re : the two lower castes; the casket is placed above the Pādukā for Brāhmaṇas, and on the ground for Kṣatriyas.

⁹⁴ 'Īśāna-paddhati', III, Ch. XXVII, 81-106; around the Brahmasthāna are the gods of the Vāstupuruṣamāṇḍala, which extends over the bottom of the Garbha vessel. The distribution of the wealth of the earth is as follows: precious stones in the centre; grains and pigments in the four directions; metals and various symbols in the eight directions; soil of different provenience in the 8 directions and in the centre; four varieties of lotus and Tagara (Tabernaemontana coronaria) in the four directions and in the centre; finally in the Brahmasthāna, (in the centre) the attributes of the God whose presence the temple enshrines; cf. 'Mayamata', XII, 88.

Brahmsthāna rest the symbols of God in the special manifestation in which his presence is invoked in the main image and in the temple itself.

During a night which is in every way auspicious to the inception of the building, the Garbha vessel is lowered to the prescribed level of the foundation. On its floor the Serpent Ananta, the Endless, is drawn. On the hood of Ananta, the Garbha-casket has its place. On the lid of the casket, on a square surface, the maṇḍala of the Earth is drawn with its seven continents, seas and mountains. The Casket as the goddess Earth contains all kinds of living beings, the moving and immovable, the Seed (bīja) and womb (garbha) of the building. She is invoked and consecrated with the rhythmic incantation: "O Thou who maintainest all the beings, O beloved, decked with hills for breasts, O ocean-girt, O goddess, O Earth, shelter this Germ (Garbha)." Earth is here the Bhūmi, the ground of being and becoming. The Seed of the temple is laid in her in the centre.⁹⁵ Its germination has been prepared in the rite of the sowing of the seeds and of the growing plants ((aṅkurārpaṇa).

⁹⁵ The seed in the central compartment (madhyakoṣṭha) is "together with Bindu and Nāda" ('Kāmikāgama', XXXI, 26-30). It is the Seed of the Supreme Principle, in its triple aspect, as Bindu, the point-limit between the unmanifest and the manifest, which is beyond perception; as Nāda, in its subtle aspect as the basic substance or principal vibration; in its gross aspect, as Bija it is the seed of everything.

V

NAMES AND ORIGINS OF
THE TEMPLE

मानं धाम्नस्तु सम्पूर्णं जगत्सम्पूर्णता भवेत् ॥

“If the measurement of the Temple is in every way perfect, there will be perfection in the universe as well”.

‘Mayamata’, XXII. 92.

प्रासादं यच्छिवशक्त्यात्मकं तच्छक्त्यन्तैः स्याद्वसुधाद्यैस्तु तत्त्वैः ।

शैवी मूर्तिः खलु देवालयारूपेत्यस्माद् ध्येया प्रथमं चाभिपूज्या ॥

“The Temple is made up of the presence of Śiva and Śakti and of the Principles and all Forms of manifestation from the elementary substance, Earth, to Śakti. The concrete form of Śiva is called House of God. Hence one should contemplate and worship it”.

‘Īśānaśivagurudevapaddhati’, Pt. III.
Chapter XII. 16.

V

NAMES AND ORIGINS OF THE TEMPLE

THE NAMES

1. VIMĀNA

"Puruṣa bears the measuring rod (māna, from 'mā'), knows division and thinks himself composed of parts. Hence he is known as Matī" (Mind; 'Vāyupurāṇa', IV. 30-31).

To measure ('mā') is to make a thing by giving shape to it and existence. Māyā or manifestation means division of the hitherto undivided Principle; on itself it performs this operation and as Puruṣa it henceforth thinks of itself as composed of parts. Puruṣa who is the first form of the Supreme Brahman ('Svetāśvatara Upaniṣad', III. 19; 'Viṣṇupurāṇa', I. 1. 2), thus bears the measuring rod. He is the great Architect of the universe and in this capacity his name is Viśvakarman.¹ He is as the God of Israel who has disposed everything—in the world, within ourselves and outside,—with measure, number and weight (Sap. XI. 20).

Manifestation comprises all that is seen; it has form, and is measurable; "all that can be measured is in the form of Umā and the measurer is the great Lord" ('Līṅgapurāṇa', LXX. 15). When Puruṣa thinks of himself, it is in the form of Umā, who shows by her name which is from the root 'mā' like Māyā, that she is the 'measured out', the manifest world come into existence by the thinking of Puruṣa. He thinks himself composed of parts while he is the measurer, the great Lord. Ontologically, the act of measuring his form is subsequent and refers back to his undivided presence; it is a reconstitution and similar to it in its purpose is the work of the architects.² It is derived from His activity whose path 'measures' the wide heaven (AV. IV. 2. 3).

¹ 'Mānasāra', II, 2-5.

² 'Prakṛti' is Māyā and the Great Lord the Māyin, 'Svetāśvatara Upaniṣad', IV, 10. In the 'Mānasāra', II. 2-35, it is said that the four progenitors and prototypes of the four divisions of architects are born from the four faces of Viśvakarman. They are Viśvakarman, Maya, Tvaṣṭṛ, and Manu. Their descendants are the Sthapati, the master builder; the Sūtragrahin or Sūtradhāra who holds the measuring rod or line, the surveyor and draftsman; the Vardhakī, the builder and painter (from 'vṛdh', to make grow) and the Takṣaka, the carpenter, see Part I note 18.

The word used here is 'vimāna', and it has remained one of the most generally accepted names which designate a temple. Vi-māna, measured in its parts, is the form of God which is this universe, the macrocosm, and the temple as well, as a middle term made by man, the microcosm, according to his understanding and by measure. To measure means here as much as to create; there is identity of measure and object³.

The Sun measures with his ray the boundaries of heaven and earth (RV. VIII. 25. 18)⁴. Viṣṇu measures the earth (RV. VI. 49. 13; VII. 100. 4). To Varuṇa, the Asura, the measurer of the earth (RV. V. 85. 5; VIII. 42. 1), belongs the line (Varuṇyā rajju)⁵.

To measure is to order. The order, which applies to the objects, is also within us, in the regularity of our breathing and the symmetry and proportion of our body. In conformity with the order of the macrocosm, the microcosm lives, ascertains its order and makes it known by uttering it, in the rhythms of its movements and voice; the latter are the metres. As the Gods have done, so does man, he builds and thereby gains the three worlds, knowing them rhythmically in their measured form and sequence. Thus it is said in the 'Śatapatha Brāhmaṇa' (VIII. 3. 3. 5): "The metre measure (mā) is this terrestrial world, for this world is measured; the metre forth-measure (pra-mā) is the air world for this is measured from this world; the metre countermeasure (prati-mā) is that heavenly world, for that world is countermeasured in the air"⁶. With this rhythmic formula (mantra) are laid down three layers of the altar (Agni); the fourth layer is the Brahman (Ś.B. VIII. 4. 1. 3).

Rhythm evokes a reality and measure builds it up. Whatever is produced is called 'meya' ('Samarāṅgaṇasūtradhāra', IX. 28). It is measurable, capable of being known, a quantity (gaṇa; 'Gaṇitasārasaṃgraha', I. 10-15).⁷ Proportionate

³ Gokarṇasvāmin (Śiva) is called "the sole surveyor (sūtradhāra) in the construction of the Universe" in a grant of Devendravarman, of the year 254; 'Epigraphia Indica', XVIII, p. 309.

⁴ The universe is measured by Savitr, the Sun (RV. V. 81. 3). The sphere over which a god rules is commensurate with his activity.

⁵ Varuṇa's cord (Ś.B. I. 3. 1. 14), in iconography, is shown as a noose. It is the fetter, while the line is the measure of Time and Death.

⁶ The rhythmic formulae for the Brhati and Vākhilya bricks, are ('Taitt. Saṃh.' IV, 3. 7. 1): Thou art Earth metre (mā), Air metre (pramā), Heaven metre (prati-mā). . . . The Season metre, the Star metre, the Mind metre, the Speech metre. . . .

The inner rhythms of man and the worlds, and their presiding divinities Agni, Vāta, Sūrya, the impelling and regulating agents in and of the special metre, are invoked in these mantras or rhythmic formulae which are addressed each to one brick, identified with the deity. Mahādhara, comm. 'Vāj. S.', XIV, 18, explains Chandas, metre, as derived from the root 'chad', to cover. Each brick, each building-unit is imbued with rhythm. It is a charged and compelling weight and shape, in the hands of the builder.

Cf. Āp. Ś.S., XVI, 28. 1. ff., the 12 mantras when laying the bricks in conformity with the golden Puruṣa.

⁷ Gaṇita, the science of quantities and their computation, mathematics, is applied to architecture, Vāstuvidyā; to Chandas, the science of rhythms, etc.; to the dimensions of this earth, to the space world (the interspace, 'antarikṣa') and to the world of light and the gods; and to the configuration and destinies of the beings therein.

measurement (pra-māna) is essential to the temple (vi-māna) and to the image (prati-mā) alike. They are 'made' by it to the same extent as the Vedic altar and also the Vēdi. When the Vēdi is outlined on the ground, with the tip of the wooden sacrificial sword, this rhythmic formula (mantra) is recited: "With the sacrifice's forth-measure (pra-mā), peri-metre (abhi-mā), counter-measure (prati-mā) and upward measure (un-mā), I comprise thee" ('Āpastamba Śrauta Sūtra', IV. 5. 4). Three fold and four fold measure is here meted out; it has direction and building power. It is the object, its energy and form. To have measured the measure, "so that one may not measure further; in a hundred autumns, not before" (AV. XVIII. 2. 38) means, that life has been lived consciously, adequately in every direction. "This measure (of life) man measures forth (pra), off (apa), apart (vi), out (nir), up (ut), together (sam), so that when he has measured it, it is said of him that he has gone to heaven" (AV. XVIII. 2. 39-45).

The temple as Vimāna, proportionately measured throughout, is the house and body of God. By temple is understood the main shrine only in which is contained the Garbhagr̥ha, the womb and house of the Embryo, the small, inmost sanctuary with its generally square plan.⁸ All other buildings within the sacred precinct, are accessory and subservient to it: the hall, Maṇḍapa, in front of the entrance, is itself, as in Orissa, a semi-separate structure to which may be added several more such buildings preparing the devotee for the entry into the temple. These accessory buildings conform in each case with the proportionate measure of the temple, the Vimāna; the Maṇḍapa, generally, coalesces with the Vimāna.

Vimāna is the name of the temple built according to tradition (śāstra) by the application of various proportionate measurements or various standards of proportionate measurement.⁹ The module is either purely architectural or being taken from the Liṅga or image in the Garbhagr̥ha is, in principle, common to the building, the main object of worship and the builder. The Vimānas are thus variously proportioned. This is explained in detail in the 'Matsyapurāṇa' and

⁸ Garbha, however, is also commonly used in the sense of cell or separate room. Similarly too, the name Prāsāda, the other most important word for temple in common use, denotes a palace or palatial structure. In this sense it is generally employed by the Buddhists in the 'Jātakas', etc., and also later in the 'Mahāvamsā', etc. References to these passages are given by A. K. Coomaraswamy, in 'Early Indian Architecture: III. Palaces', 'Eastern Art', Vol. III. The ordinary designation of the separate rooms in a Pāsāda is Gabbha, *ibid.* p. 191. Gabbha denotes 'cell' in the cave inscriptions, note 102. To these words in their Pāli usage, correspond many others, such as Vēdikā, *ib.*, which here denotes any balustrade and not only one around a sacrificial platform (vēdi).

⁹ This definition is given in the 'Īśānaśivagurudevapaddhati', III. Ch. XXVIII, 2; and repeated in the 'Śilparatna', XVI. 2. Vimānam denotes as well a chariot of the gods, the sky-travellers (AV. X. 8. 3; 4th Rock edict of Aśoka; cf. 'Arthaśāstra', II. 32. 49, 'devaratha') and a temple-construction, either of which are proportionate in their parts as laid down by tradition. 'Samarāṅgaśāstradhāra', XLIX. 2-9; 'Vaikhāṇasāgama', XLI., see also Part VII. Vimāna, in Buddhist texts, usually means a palace of the gods, cf. 'Mahāvamsā', XXVII. 9, 10, 13, where the Lohapāsāda is to be built 'like' a palace of the gods, or aerial palace ('dibba-vimāna' or 'akasaṭṭha-vimāna'), Coomaraswamy, *l. c.*, p. 181. The 'Vimāna-Vatthu' deals of the celestial abodes destined for different beings according to their merits. In the Epics, Vimāna means a seven storeyed building, acc. to the commentary ('Tilaka' of 'Rāmāyaṇa', II. 33. 3 and II. 57. 18).

'Garuḍapurāṇa', and also in the 'Hayaśīrṣapañcarātra'¹⁰. The purely architectural standard of proportionate measure¹¹ is generally the width of the square of the Prāsāda. This is the width of its wall, measured on the outside. The wall, as a rule, is thick; its inside width which is that of the Garbhagrha is generally half of its external width¹². The total height of the Vimāna is double the external width of the wall¹³. These pure octaves of proportionate measurement however are not the only architectural relations (Part VII).

The other standard of proportionate measurement of the plan and section of the building is not architectural; it is the height of the Liṅga¹⁴ or the image¹⁵ in the Garbhagrha. The measure of the donor, the Kāraka or Yajamāna enters into that of the building, if the Liṅga or image is considered as measured according to the 'aṅgula', his finger measure¹⁶; in this vestigial survival, the measure of a 'puruṣa', the length of man, is in certain temples at least, also the module of the Vimāna. Ś.B. X. 2. 1. 2; 2. 6, gives the measure of the Altar by finger breadths and also by the measure of man with arms stretched up.

2. PRĀSĀDA

Vimāna, as name of the main temple building, is synonymous with Prāsāda. These two are the most significant words for temple.¹⁷ There are many more, for the house of God has more than one aspect and origin.

¹⁰ See Chapter VII, first chart, giving the proportions of Prāsādas, the 'common' (Sarvasādhārāṇa) standard and others.

¹¹ The absolute measures which were generally accepted, see Part II, note 89.

¹² The rule, that "the width of the wall on the outside should be twice the width of the Garbhagrha is observed in the sixth century A.D. ('Bṛhat Saṃhitā', LV. 12; subsequently 'Matsyapurāṇa', CCLXIX, 1, and up to a recent past if not to this day, where traditional practice has not as yet become extinct, as for instance in Orissa, cf. 'Bhuvanapradīpa', LXXXIII, quoted and translated by N. K. Basu, in 'Canons of Orissan Architecture', p. 119. Re. other proportions, see however Part VII.

¹³ Bṛhat Saṃhitā', LV. 11.

¹⁴ 'Matsya Purāṇa', CCLXIX. 8; 'Garuḍa Purāṇa', I. XLVII. 10-13.

¹⁵ 'Hayaśīrṣapañcarātra', XIII. 318; 'Agnipurāṇa', XLII. 9-11. The more general reference seems to be to the Liṅga. The connection of Liṅga and temple appears more close and may be more original than that of image and temple.

¹⁶ The 'svairāṅgulapramāṇa' given in the 'Bṛhat Saṃhitā', LVII. 4, and elsewhere denotes a division of the image. In the 'Sukranītisāra', IV. 4. 82, however, 'aṅgula' measures one-fourth part of the fist of the donor. According to the 'Piṅgalāmata', however, P. C. Bagchi, 'Piṅgalāmata', ch. IV, JISOA, vol. XI. p. 157, aṅgula is the breadth measurement of the upper phalange of one's own thumb. This relative unit of measurement became standardised as 8 yavas = 1 aṅgula. In the 'Samarāṅgaṇasūtradhāra', LXVII. 27, which deals of Maṇḍapas, the 'hasta' measure is that of the donor himself (gṛheṣītā, lit. householder), cf. Part II, note 89.

¹⁷ I.P., III. ch. XXVIII, 1-2, explains them in the introductory śloka of the chapter on the architectural distinctions (lakṣaṇa) of Vimānas, etc. from where the Śilparatna', XVI. 1, has taken the same definition: "Prāsādas please (prasidanti) by their beauty the minds of gods and men." This they do, in virtue of their meaning and form. The temple is seen and comprehended by the look of knowledge.

The temple is the seat and dwelling of God, according to the majority of the names. The name *Prāsāda* has the widest application.¹⁸ The word does not mean a house or something that is built up. It denotes a settling down (*pra-sad*) and

Popular etymology accounts here for the meaning of the word *Prāsāda*. Its more recondite but essential meaning is explained in the I.P. itself.

The *Amarakoṣa* explains: "Harmyādīdhaninām vasāḥ *prāsādo devabhūbhujam*." Harmyas, etc. are the residences of the wealthy; *Prāsādas* are the residences of gods and kings.

¹⁸ *Prāsāda*, in the sense of a sacred monument or sacred building is referred to in ancient texts and inscriptions: 'Sāṅkhāyana Śrauta Sūtra', XVI. 18. 13-17: *Prāsādas* on all sides of the Ahavaniya fire. Patañjali, 'Mahābhāṣya', II. 2. 34: *Prāsādas* of Dhanapati, Rāma and Keśava. The testimony of the Śrauta Sūtras and Gṛhya Sūtras is assigned to the Mauryan age (3rd century B.C.), the date of Patañjali is about 200 B.C.

'Vedic Index', II. 44, understands *Prāsāda* (Sāṅkh. Ś.S., 1.c.), as raised platform on a mound. *Prāsāda*, in the sense of palace does not occur until the 'Adbhuta Brāhmaṇa'; 'Weber, Indische Studien', I. 40; cf. 'Vedic Index', II. 51.

In the Epics, *Prāsāda* has the meaning of "3 storeyed building" ('Rāmāyaṇa', comm. 'Tilaka', II. 33. 3. and II. 57. 18). It is compared with Mount Meru and the Vindhya Mountain (II. 88. 5-7; IV. 33. 7); it is very high and snow-white ('Rāmāyaṇa', VI. 26. 5). Although of three storeys only its height need not have been less than that of the seven storeyed Vimānas. The commentary 'Tilaka' (II. 57. 18), defines *Prāsāda* as palace of the king; in II. 33. 3, Harmya is thus defined, whereas in the latter passage, *Prāsāda* is explained as the house of the wealthy. While neither Vimāna nor *Prāsāda* are used in the sense of temple,—the words designating the house and seat of God, not necessarily a temple but a sacred monument, in the Epics are: Devagṛha ('Rāmāyaṇa', III. 55. 7) and Devāyātana (I. 5. 10-15), Devasthāna ('Mahābhārata', Sabhā. 46. 34; see also E. Washburn Hopkins, 'Epic Mythology', pp. 70-73)—their descriptions seem to imply a symbolic meaning. The 3 storeys may denote the 3 worlds—earth, air and heaven ('Nirukta', VII. 5); the seven storeys, their seven fold division (RV. VIII. 40. 5; X. 104. 8). Re. the 'whiteness' see Part IV, p. 123 and re. the designation 'Meru' etc., see Parts VI and VII.

Further references to *Prāsāda* in the 'Mahābhārata' and 'Rāmāyaṇa' are given by P. K. Acharya, 'A Dictionary of Hindu Architecture', pp. 420-22. A number of inscriptions, of later ages, where *Prāsāda* means temple, are put together ib. pp. 423-30.

Prāsāda, however, has retained the meaning of building or palace, in the 'Samarāṅgaṇa-sūtradhāra', XVIII. 22; whereas in the many chapters of this text which treat of temple architecture the word which most frequently designates the temple is *Prāsāda*.

Here are some of the earliest inscriptions: On a Garuḍa pillar from Bhilsa, an 'uttama *Prāsāda*, of Bhagavat, 2nd century B.C., J. N. Banerjea, 'The Development of Hindu Iconography', p. 102; Mathurā Jain Inscr., 'Ep. Ind.', vol. II. p. 198; XI. p. 17.

The 'Vejayanta *Prāsāda*', the *Prāsāda* of Indra, represented in a relief panel in Barhut ca. 1st century B.C. and inscribed (Coomaraswamy, HIIA, Fig. 43; and 'Early Indian Architecture', 'Eastern Art', vol. III, Plate XCII. 1), is a 3 storeyed building, full of Apsarās, etc., in its hall on the ground floor; they look out from arched dormer windows or doors leading to the balcony, in the 2nd and the 3rd storey; the roof is waggon-vaulted. Contiguous with the 3 storeyed building is a circular, open pillared shrine, with a round dome, and a separately projecting cornice below; the dome is inscribed "Sudhamma Deva-Sabhā".

'*Prāsāda-devālaya*' occurs in the Nālandā stone inscr. (vs. 4-6) of Yaśovarmanadeva, c. 530. A.D.; 'Ep. Ind.', vol. XX. p. 43. Other inscriptions referring to extant temples (*Prāsāda*) and sites, are for example the one of the Lakṣmaṇa Temple, Sirpur, (c. 700 A.D.), 'Ep. Ind.', vol. XI. p. 190; or the Gurgi inscr. of Prabodhaśiva, 'Ep. Ind.', vol. XXII. p. 127.

The 'Mayamata', II. 6-7, enumerates the following buildings as *Prāsādas*: Sabhā, Sālā, Prapā, Raṅgamaṇḍapa and Mandira; they are part of the whole establishment of a South Indian temple. The meaning of *Prāsāda* is extended here from the temple itself (mandira) to the various halls, etc. which are attached to it. Cf. however the meaning of Sabhā in the Barhut inscription.

a seat made of that which has settled down and acquired concrete form, the form of a dwelling, a residence, the seat of God. The rhythmic formula (mantra) which effects the settling, setting or steadying of the bricks of the Fire Altar is the Sādāna mantra (Vāj. S. XII. 53)¹⁹. The meaning of Prāsāda is given explicitly in the 'Īśānaśivagurudevapaddhati', Part III, chapter XII, verse 16. "The temple, Prāsāda, is made up of the presence of Śiva and Śakti, and of the Principles and Forms of Existence (tattva) from the elementary substance Earth (Vasudhā) and ending with Śakti. The concrete form (mūrti) of Śiva is called House of God (devālaya). So one should contemplate and worship it first."

This is in complete conformity with the meaning of the temple and the 'bricks' of which it is built. They are imbued with the presence of Śiva and all the Principles of Existence.²⁰

The house of God (devālaya) is the concrete manifestation (mūrti) of Śiva or of any other name under which is beheld the Supreme Principle, to the same degree as the corresponding image (mūrti). The 'form' according to which either is made is Śiva as Prāsāda mantra²¹.

An explanation of Prāsāda from the Śaiva point of view is given below, based mainly on the 'Īśānaśivagurudevapaddhati', a compendium dating from about 1000 A.D.

The rhythmic formula, the Prāsāda (mantra) is Nāda ('Tantrasamuccaya', I. ch. V. 51, comm.). Nāda, the principal vibration, is the immanent cause (upādāna)), the primary substance of the world.

¹⁹ The 'sādanam' of the bricks of the Fire-altar (Ś.B. VI. 1. 2. 28; VII. 1. 1. 30) is the prototype of the invocation of the goddesses, the Bricks (Part IV. page 112), who are forms of Vāk.

Prāsāda in Śāṅkh. Ś.S. XVI, which is defined as 'raised platform', 'Vedic Index', II. 44, as its name implies, is originally a 'seat' piled up, a Citi.

The 'Nānārthārnava Saṃkṣepa', II. śl. 160 (T.S.S., p. 25) says: "The word Prāsāda is used in the sense of "well set" and "in the middle of the temple (mandiram)"; or it is its central part in which is the inmost sanctuary".

²⁰ The translations here and on p. 130, intentionally use words somewhat different whose meaning may be inferred from the text.—'Īśānaśivagurudevapaddhati', III. ch. XXVII. 62 f; treats of the 'bricks'.

The 'Agni Purāṇa', LXI. 11, similarly says that the 'whole Prāsāda is to be understood as Puruṣa'; and "Lord Hari himself is visibly established in the Prāsāda" (26. b). See also 'Agni Purāṇa', CII. 14 and CII. 22-23.

²¹ The image of Śiva with 5 faces and 10 hands or as an alternate shape with four hands, is to be meditated upon as seated on a white lotus. The image corresponds to the Prāsāda mantra. The 10 hands on the right hold the following weapons, etc.: skullstaff, trident, spear, 'varada' and 'abhaya mudrā', which bestow boons and assure fearlessness; serpent, rosary, drum (ḍamaru), lotus, and lemon (bijapūraka) on the left. ('Ī.P.', II. ch. XXVIII, 61-64; 'Tantrasamuccaya', Pt. II. VII. 137). "He who does not know the Prāsāda, its great body of five mantras [pañcamantramahātānu ('Agnipurāṇa', CCXIV. 40); the 5 mantras are Īśāna, Tatpuruṣa, Aghora, Vāmadeva and Sadyojāta; (JISOA, vol. IX, pp. 174-75; 193) together with the 38 Kalās (the 38 Kalās: Ī.P. III. ch. VI. 36; 'Śāradātilaka', XVIII, 1-23; see 'Ī.P.', III. ch. XII. 82, JISOA, vol. X. p. 235, note)] cannot at all be called an Ācārya ('Agni Purāṇa', CCXIV. 41). The five mantras are equivalent to the 5 faces, Īśāna, Tatpuruṣa, Aghora, Vāmadeva and Sadyojāta, of the image. The principles of manifestation (tattva) are invoked on the image; they are allocated to its limbs and parts and are supported by them (see Part VIII).

The Supreme Principle, the Śivatattva, is Brahman which is bliss beyond the distinction of subject and object, knower and known, beyond time; undifferentiated, solid-Consciousness (cidghana). Śakti is not separate from Śiva, she is the energy or process of Consciousness with its willing, knowing and creating (Icchā, Jñāna and Kriyā Śakti) and leads from the unmanifest across the threshold of her own activity, where Śakti herself is Bindu, the point to the unmanifest; from here manifestation begins.²²

Bindu, the Point, is 'parā', beyond (the manifest), as well as 'aparā', manifest. This latter aspect has two degrees, subtle and gross. In its subtle capacity, Bindu is Nāda, the principal vibration; in its gross capacity, it is Bija, the seed of everything. Nāda gives Mokṣa, release; it is Śūnya, the Void. ('I.P.' part III. ch. VI. 3 f). The High Point of the finial above the superstructure of the temple is the visual equivalent of Bindu.

Śūnya, the Void, is Śakti as Kalā: Śiva pervades everything, is solid, undifferentiated-Consciousness; Śakti, as Śūnya, is vacuity-creating energy where things take shape and place as parts (kalā) of existence. This is negativity as a function of Consciousness whereby its contents are made positive. Prior to this function, which produces separateness and individuation, there is no thing in the beyond. The presence of Śakti with Śiva is and produces all the Principles of manifestation from Earth to Śakti.

The temple, Prāsāda, is the symbolic substance, which, as a substratum, corresponds to the principal substance and immanent cause (upādānakāraṇa), Nāda, the principal vibration. From Nāda, the principal vibration, the world is made. This is shown by the rhythmical plan and structure of the Prāsāda. Such is the meaning of Prāsāda, the most generally employed name for the Hindu temple. It denotes especially the structural pile below, around and above the sanctuary (garbhagṛha).

FURTHER NAMES OF THE TEMPLE

Other words for Temple with a wide currency and generally employed are: Devagrham, Devāgāra, house of God; Devāyatanam, Devālaya, Devakulam²³, meaning seat or residence of God; Mandiram, Bhavanam, Sthānam²⁴, Veśman²⁵,

²² Somewhat differently worded, the 'Agni Purāṇa', CCXIV. 33, says "by the recitation of the Prāsāda mantra, Nāda is roused".

Some Ācāryas consider Nāda, principal vibration, as the first among the Tattvas or principles of manifestation, and then Bindu, the point limit from where manifestation begins (kārya bindu; 'Tantrasamuccaya', part I, ch. V. 50, comm.).

²³ 'Manu Smṛti', IX. 280 (devatāgāra); 'Gṛhya Sūtras', 'Śāṅkhāyana', II. 12. 6, etc.; 'Pañcatantra', Bk. I. story I. 27 f.; "Śaila devagrha" (a stone temple), Mora well inscription, 'Ep. Ind.', XXIV. p. 194. Devakulam, Bhāsa's 'Pratimānāṭaka', III; 'Ep. Ind.', XXI. p. 81 (Gupta inscr.), is a small shrine, cf. 'Temple, Door, Throne, etc.' by St. Kramrisch, JISOA. vol. X. pp. 210 ff.

²⁴ Mathurā inscriptions, 'Ep. Ind.', I. p. 390, No. 18; 'Indian Antiquary', XXXIII, p. 102,

meaning waiting or abiding place, dwelling; abode; station or abode; entrance or dwelling, respectively; Kīrtanam²⁶, Harmyam (from 'hr', to take) a palatial building and Vihāra (also from 'hr', to take asunder, 'vi-har'; to construct)²⁷.

A seat and house of God is the temple by most of its names. The names Caitya and Kṣetra, however, the Hindu temple has inherited from the piled up sacred monument and from the sacred ground in the place of which it was to arise.

In Vāstu-Śāstra, the synonyms are listed and throw some light on the multiple origins of the Hindu temple.²⁸ The 'Samarāṅgaṇasūtradhāra' (XVIII. 57), gives the following names to the place for the gods: (1) Deva-dhīṣṇya, (2) Sura-sthāna, (3) Caitya, (4) Arcā-gr̥ha, (5) Devatā-āyatana and (6) Vibudha-āgāra. They designate (1) a seat²⁹, (2) an establishment, (5) a residence and (6) a house³⁰ of god (deva, sura, vibudha); whereas Arcā-gr̥ha is the house of the consecrated image, and Caitya is a sacred monument which is piled up like the Vedic Agni (citi). These are ancient names.

No. 13; also 'Ep. Ind.', vols. VI. p. 202; IX. p. 240; JBAS. vol. XLII. part I. p. 130. Sthāna, (Brahmāsthāna; Mbh. III. 84. 103); 'Mahā-sthāna', 'Ep. Ind.', XXIV. p. 210.

²⁵ 'Ep. Ind.', vols. IX. p. 254 (Pathari stone inscr. V. S. 917); III. p. 15. (Śrīrangam inscr., about 1250).

²⁶ Nālandā inscr. of Yaśovarmanmadeva about 530 A.D. (verse 13), 'Ep. Ind.', vol. XX. p. 43; Lakṣa-maṇḍal inscr., about 500 A.D., 'Ep. Ind.', I. p. 15; copperplate inscr., referring to the Kailāsanāth temple at Elura, 8th century, 'Indian Antiquary', vol. XII, pp. 229, 289; Khalimpur plate from Malda, Bengal, 9th century; 'Ep. Ind.', vol. IV. p. 239; Brahmā temple at Dudahi, ASI Report, vol. X.

Kīrtanam or Kīrti is a temple or any work of art by which the builder praises the glory of the Lord and through which he attains fame (cf. Kīrtistambha); see also Part I, note 17.

²⁷ "House of the wealthy" acc. to 'Amarakoṣa' (see also note 17); Mathurā inscr., 'Ep. Ind.', vol. IX. p. 241; vol. XXII. p. 124 (inscr. of Viṣṇu temple at Bayana, Bharatpur; dated V.S. 1012)—Harmyam and all the other more frequent names occur in early and late texts and inscriptions.

Harmya is also the name of the 'upper floor' (uparibhūmi; 'Samarāṅgaṇasūtradhāra', XVIII. 10). Harmikā is the small square shape on top of a stūpa. Harmya also designates the 'High Temple' (Parts VI, VIII; 'Śilparatna', XVI. 53).

Vihāra is originally the sacrificial ground (Kātyāyana, I. 8. 26). It is the space between the sacred fires.—A. Būrk, ZDMG. 1902, on p. 307, "The 'Āpastamba Śulva Sūtra'" translates 'vihāra' as 'method of construction' (of Vedic, Agni).

Vihāra generally designates a Buddhist monastery. In a Jain inscription from Jalor, 1186 A.D., Vihāra refers to a temple of Pārśvanātha. ('Ep. Ind.', XI. p. 55).

²⁸ The 'Mayamata' (XIX. 10-12), gives the following 29 synonyms used for a building: (1) Vimāna, (2) Bhavana, (3) Harmya, (4) Saudha, (5) Dhāman, (6) Niketanam, (7) Prāsāda, (8) Sadanam²⁹, (9) Sadma, (10) Geha, (11) Āvāsaka, (12) Gr̥ha³⁰, (13) Ālaya, (14) Nilaya, (15) Vāsa, (16) Āspada, (17) Vāstu, (18) Vāstuka, (19) Kṣetra, (20) Āyatana, (21) Veśma, (22) Mandira, (23) Dhīṣṇyaka, (24) Pada, (25) Laya, (26) Kṣaya, (27) Āgāra, (28) Udavasita and (29) Sthāna. Many of these are synonyms used for a building or for house in general and the numbers 2, 6, 8, 9, 10, 11, 12, 22, 23, 26, 27, 28 (vasati) and (8) (saṁsthāna), accord with those enumerated in the 'Samarāṅgaṇasūtradhāra', XVIII. 8-9, where the appellations are given denoting a house or building. But for Tala and Kaṣṭha, the 24 synonyms of the 'Mānasāra', XIX. 108-12, occur in the list of the 'Mayamata' whereas the names Saṁśraya, Nidhanam, Nīḍam, Śaraṇam, Okāḥ and Pratiśraya are found in the S.S., 1.c.

THE OBJECT IN BUILDING A TEMPLE

“Let him who wishes to enter the worlds that are reached by sacrificial offerings and the performance of religious obligations (iṣṭāpūrta) build a temple to the gods, by doing which he attains both the results of sacrifice and the performance of religious obligations” (Br. S. LV. 2)²⁹. The commentary explains that sacrificial fire offerings are called ‘iṣṭa’ and all other offerings are ‘pūrta’. The latter include the construction of tanks, wells, lakes and houses of the gods (devatāyatana). The sacrificial offerings secure for the sacrificer a place in heaven (svarga) according to the merit of his sacrifice. The Yajamāna, the sacrificer, is the donor of the temple; his sacramental person, transformed by his sacrificial and other offerings is transferred to heaven. The duration of his stay there is permanent (nitya) according to Kāśyapa, quoted by Utpala, the commentator of the ‘Bṛhat Saṃhitā’; this is secured by the enduring nature of the shrine. Essentially, the acts and rites in building the temple are sacrificial³². With these go lasting concrete and beneficial results embodied in the building, active in all the planes into which the temple symbolically reaches both in this and the other worlds.³³ Where the Fire-altar, Agni, acted mainly as instrument and sacramental

²⁹ The Sasbahu Temple (Gwalior) is called Hari-sadanam, Sadanam of Viṣṇu, in the inscription of Mahipāla (A.D. 1093), ‘Ind. Ant.’, vol. XV. p. 33; cf. Ś.B. VI. 1. 2. 28; note 19.

³⁰ Devagrha, however, is not only a house of God on earth; it is also the name of the luminaries, the abodes in the firmament of those Ṛṣis, etc. who attained Deva-hood by their Karmas. The stars and the luminous spheres in the firmament are Devagrhas; ‘Matsyapurāṇa’, CXXVIII. 39-41. Cf. also the meaning of Vimāna as ‘prototype’ of the temple; Part VII.

The other names which have not been explained as yet, denote: Saudha, a plastered, palatial building; Dhāman, a residence; Sadanam and sadma are from the same root ‘sad’ as Prāsāda; 13, 14 and 25: Laya, Ālaya and Nilaya, a place of rest, a residence; 16 and 24: Pada and Āspada, a station; 15, 17 and 18: Vāsa, Vāstu and Vāstuka from ‘vas’ (pp. 82-3) and 19: Kṣetra, sacred ground and abode (see note 28).

The ‘Kāśyapaśilpa’ (XXIII. 1), enumerates as synonyms: Prāsāda, Sadanam, Sadma, Harṇyam, Dhāman, Niketanam, Mandiram, Bhavanam, Vāsa, Geha, Divya-Vimānaka, Āśraya, Āspada, Ādhāra and Ādhārapratidhiṣṭya. Āśraya, Ādhāra and Ādhārapratidhiṣṭya signify the support which the temple, being a seat, gives to divinity.

³¹ Kern translated, l.c.: “meritorious deeds of piety and charity”, a Christian interpretation; Iṣṭa, derived from the radical ‘Yaj’, the commentary explains are Yajña, that is offerings through fire. See Sāyaṇa’s commentary on RV. X. 14. 8.

³² One of the main sacrifices being the Vāstu-homa.

³³ “For the purpose of increasing the religious merit of his parents and of himself” says the Gwalior stone inscription of Mihiragula, was the stone temple (śailamaya Prāsāda) of Sūrya set up there (‘Corpus Inscriptionum Indicarum’, vol. III. p. 162). For such reasons also, the ‘Agnipurāṇa’ ch. XXXVIII. 25-26, says “having got wealth by luck or exertion one should give it in the proper way to the best among the twice-born and cause temples to be constructed.” In the same chapter it is also said that a poor man building the smallest shrine reaps the same benefit which a rich man does by building the largest temple (XXXVIII. 10-11).

This is in general the stated purpose; the temple by the symbolism of its architecture gives to it a detailed and definite exposition.

body of the sacrificer for the attainment of his ultimate purpose, the temple ostensibly stays as a monument of its function. Its permanency depends upon its substance and on many factors which work on the monument while it stands, and affect it in time.

Other factors, of the period and place influence it, while it is being built and leave their mark on its style. Whereas temples are built in differing styles, the Fire-altar is subject to no such variation; its shape is independent of time and place, independent even of extensiveness, so much so that one of the types of the Vedic Altar is prescribed to be made of rhythms only (*chandaściti*) and not of bricks which are their representatives³⁴. Ancient extant temples and preserved texts date from about the same age³⁵. In the northern half of India it coincides with the rule of the Gupta Dynasty. The 'Br̥hat Saṃhitā' and the 'Matsya Purāṇa', the former of the sixth century A.D. refer to the standard works on which they are based. Varāhamihira, the author of the 'Br̥hat Saṃhitā',

³⁴ 'Baudhāyana Śulva Sūtra', II. 62-86; "In the case of the *Chandaściti*, the Agnicit, the builder of the Fire-altar, draws on the ground the Agni of prescribed shape. He then goes through the whole prescribed process of construction imagining all the while that he is placing every brick in its proper place with the rhythmic formula (mantra) that belongs to it. The mantras are recited but the bricks are not actually laid. The *Chandaściti* thus is the Citi or altar made up of Chandas, rhythms, or mantras instead of bricks or loose mud pieces (B. B. Dutt, 'The Science of the Śulba', p. 3, note).—Cf. the 36,000 Fire-altars made of mind, speech, breath, etc.; 'Vedānta Sūtra', III. 3. 44 (Śaṅkarācārya's comm.).

The rhythmic formulæ, the mantras however, even mentally recited, are extended in time. This time is not the dated time of history. It has its architectural analogy and notation in the *Talacchanda*, the ground plan of the temple (Pt. VII).

An apparent exception to the aloofness of the Vedic altar from any geographical or ethnical factor is given in S.B. XIII. 8. 1. 5 (note 60). The northerners and easterners had round sepulchral mounds in contradistinction to those who knew the Three Vedas and whose sepulchral mounds were square. This is but an application of the supremacy of the four cornered shape; a lesser value is assigned to the circular shape.

³⁵ The 'Gṛhya Sūtras' refer to the shrines of gods as 'devagr̥ha, devakula', also 'devāyatana' (cf. note 23). The 'Āpastamba Gṛhya Sūtra', VII. 20 describes the carrying about of images by the house-holder and the placing of them in huts built for them. The 'Adbhuta Brāhmaṇa' (Śaḍvimpśa Brāhmaṇa, X. 5) speaks of 'devāyatanam' which may, but need not mean a temple.

Temples, under the control of Government are mentioned by Megasthenes.

Re. remains of temples such as foundation walls only, see Part IV.

Representations of temples, abound in reliefs at Barhut, Sāñci, Bodhi-Gayā, Mathurā. Shrines are also represented on a few coins prior to and at the beginning of the Christian era (J. N. Banerjea, 'The Development of Hindu Iconography', Pl. I, Fig. 16, see note 89; Coomaraswamy, HILA, Pl. XXX, Figs. 116, 117, 126A). These early representations of various types of shrines do not correspond, as a whole, to the actually preserved temples of subsequent ages, although in some of their parts there is continuity and development. Some of the early types of temples, however, such as those on the Audumbara coins of the Punjab have their structural equivalent in Bengal temples of the present day.

'Shrines' (*koṣṭhaka*; apartment, separate chamber or place) of Aparājita, Apratihata, Jayanta, Vaijayanta, Śiva, Vaiśravaṇa, and the Aśvins in a fort, and the house (*gṛha*) of the goddess Mādīrā, and "koṣṭhaka-ālayas" for the Vāstudevatās are spoken of in Kautilya's 'Arthaśāstra', II. iv. (56) which, according to A. B. Keith seems to belong to the fourth century A.D. ('The Age of Arthaśāstra', 'B.C. Law Volume', p. 490).

concludes his chapter on the Description of Temples (*prāsādalakṣaṇam*) with the modest statement that it is a brief summary of the work of Garga, and that reference has been made in it also to the elaborate treatises by Manu and others (ch. LV. 31). Elsewhere (29 f.), in the same chapter, Maya and Viśvakarman are quoted as authors whose seemingly different statements have the same meaning. The body of architectural knowledge behind the short compilation of the 'Bṛhat Samhitā' is supported by the names of eighteen chief preceptors (*ācārya*), of the traditional science of architecture, *Vāstusāstra*, listed in the 'Matsyapurāṇa'³⁶. The many names seem to indicate an equal number of branches or schools of Indian architecture prior to the sixth century A.D. and subsequently. The reconciliation of apparently conflicting statements about proportionate measurement (Br. S. LV. 30) can be taken as symptomatic of the diversities of the schools and their exponents³⁷. They represented as many variations as lay within the fundamental purpose of the temple. The merit of the works of the schools which made it seem worth while to record the names of their most eminent preceptors lay in the manifold and ever varying solutions of their central purpose. This was the setting up of the *Prāsāda* as *Vimāna*, proportionate in its parts and directing the form and measure of all the other buildings which accrued in the service of the *Prāsāda*.

The diversity of the types of temples at one and the same site even may be seen for example within the enclosure of the temple of *Makūteśvaranātha*, near *Bādami*, in the *Bijapur* district. The widest range to which the architecture of the *Prāsāda* attained in the tenth century in northern and southern India is also represented by these early shrines. The temple dedicated to *Śiva Makūteśvaranātha* was built in the sixth century³⁸.

³⁶ The names of the 18 great architects are enumerated in Chapter CCLII, verses 2-4. They are: *Bṛghu*, *Atri*, *Vasiṣṭha*, *Viśvakarman*, *Maya*, *Nārada*, *Nagnajit*, *Viśālākṣa*, *Indra*, *Brahmā*, *Svāmīkārṭtika*, *Nandiśvara*, *Saunaka*, *Garga*, *Śrī Kṛṣṇa*, *Aniruddha*, *Sukra* and *Bṛhaspati*. To *Viśvakarman*, *Maya* and *Garga*, are attributed definite statements by *Varāhamihira*. Besides these three *Ācāryas*, others too, of whom nothing is known as yet but their names, are relied upon in the texts on architecture. The number 18, of the great architects is also the number of *Purāṇas*; and of the places (*sthāna*) of calculation ('*Viṣṇupurāṇa*', VI. 3. 4., '*Vāyupurāṇa*', CI. 102 f.).

³⁷ The structure of the temple is a work of art and science. Their knowledge and practice are conducive towards the same end, the making of a perfect instrument whose sight and ritual use procure release.

Hiuen Tsiang (S. Beal, 'Records of the Western World', I. p. 78) speaks of 5 *Vidyās* or *Sāstras*, traditional sciences, the second of which is *Śilpasthānavidyā*. As the name of this science indicates, it included the arts (*śilpa*) and architecture (*sthāna*; houses, squares, courts etc.) and mechanics; it explains the principles of *Yin* and *Yang* and the calendar.

In the '*Sukranītisāra*', IV. 3. 30, also, *Śilpasāstra*, enumerated as one of the 32 sciences, includes architecture and the making of images. Architecture, moreover and painting (ib. 83-84) are enumerated by *Sukrācārya* amongst the 64 arts (*kalā*); and architecture (*vāstuvidyā*) and sculpture (*takṣakarma*) are similarly enumerated in *Jayamaṅgala's* commentary to *Vātsyāyana's* '*Kāmasūtra*', Ch. I. 3 (see Part I, note 20).

The double listing as science as well as art of architecture and sculpture does justice to their two-fold nature. This is also implied in architecture being part of *Jyotiṣa* (astrology) and *Kalpa* (ritual), two of the six *Vedāṅgas*. (See Part I, note 21).

³⁸ An inscription dated 601 A.D. and found on the site, engraved on a pillar, speaks of this temple (*devagṛha*). It is a storeyed building crowned by a dome shape. Other temples

THE HINDU TEMPLE

In the Hindu temples, such as they are known, and for which the texts lay down rules, the Prāsāda is the shell of the Garbhagrha. The Garbhagrha is essentially a small dark chamber, square in plan³⁹. In this respect it is unchangeable throughout the ages. The problems of architecture, developed in the West, to build a space resonant with the rhythm of the prayer and concentration of an assembled community, remained outside the Prāsāda. The Hindu temple is built with the fervour of devotion (bhakti) as a work of offering and pious liberality, in order to secure for the builder, a place in heaven, which means a high level of inward realisation and to increase the religious merit of his near relatives: by a transfer of merit, the Prāsāda functions similarly, for every devotee, who comes to and enters the temple. The temple is built as a work of supererogation, with the utmost effort in material means and the striving of the spirit so that the Prāsāda attains and leads to the Highest Point⁴⁰.

Congregational worship has no place in Hinduism⁴¹. It determined however the apsidal plan of the barrel-vaulted Caitya-hall, the Buddhist temple. The resolve to build and generally also the funds for the building were the contribution of the Yajamāna or Kāraka and he entrusted the work to priest and craftsman. The merit of their knowledge came back to him who had employed, remunerated and then dismissed them⁴².

within the enclosure have superstructures of a different type, curvilinear and also in the shape of a stepped pyramid—see Part VI, and H. Cousens, 'The Chālukyan Architecture', op. cit., Pls. XXVI, XXVII.

³⁹ Or, rarely, rectangular and still less often, polygonal or circular, cf. the shape of sacrificial altars, Part II.

⁴⁰ The liberating effect in building a temple is expressed in the 'Saivāgamanibandhana', XIII, second but last verse (a Ms. from Tripunithura, cited without translation, by N. V. Mallaya, 'Studies in Sanskrit Texts on Temple Architecture', JAU. vol. IX. p. 172). It says that he who builds a temple of Śiva leads his ancestors of 21 generations to the world of Sambhu (Śiva).

In the 'Mahānirvāṇa Tantra', XIII. 240-44, the Temple is praised: "Thou grantest merit (puṇya) and fame . . . ; all the holy places are in thee." The temple, like worship itself, serves more than one purpose. "One should worship with Sattva tendencies [in conformity to the Essence] for liberation; with Rajas tendencies [expansively] for enjoyment and with a mixture of these tendencies for the fulfilment of mixed purposes" ('Viṣṇu-Saṃhitā', IV. 12).

⁴¹ The single worshipper, or in South India, only the priest of the temple and the 'pūjārī' enter the Garbhagrha and perform the sacred rites for the worshipper.

When, as with the Vaiṣṇavas, congregational songs, etc., are performed, this takes place in front of the Garbhagrha, in the Maṇḍapa, and leaves unaffected the form of the Prāsāda, with its small Garbhagrha.

The apsidal plan and barrel-vaulted structure is classified as Hastiprsthā or 'elephant-back' in Vāstu-śāstra (see Part VII). It was re-adjusted for the purposes of Hindu worship by the introduction of internal walls so as to seclude the Garbhagrha from the rest (Durga temple, Aihole, 6th century; Cousens, op. cit. Pl. XI) or by a flat stone ceiling to exclude the vaulted roof in the brick temple of Kapoteśvara at Chezarla, Guntur District (Report of the Southern Circle, ASI., 1917-18, p. 35, Pl. XVIII).

⁴² The Sthapati, the master builder, himself a Śilpin, is the Guru of the three other classes of Śilpins, the Sūtragrahin, Vardhakin and Takṣaka. In the performance of certain architectural rites the Sthapati may officiate as priest ('Mānasāra', VIII.). In these, as well as other, prescriptions there is no absolute or dead uniformity in Vāstuśāstra (see Part I. p. 9). The Śilpin is the Kārṭṛ in relation to the Kāraka, the patron.

To the pilgrim and devotee who goes to the temple, it is a Tirtha made by art, as others are by nature, and often it is both in one. A Hindu temple unlike the Vedic altar does not fulfil its purpose by being built; it has of necessity to be seen. Darśana, the looking at the temple, the seat, abode and body of divinity and its worship (pūjā), are the purpose of visiting the temple. To fulfil this purpose in addition to being an offering and work of pious liberality the temple has not only its proportionate measurement but also the carvings on its walls, and the total fact of its form.

The Prāsāda as far as preserved temples show, consists of thick walls and a roof forming a dark square chamber entered through a door with a more or less elaborate frame. Whereas in the later temples the superstructure is raised to

When the building of the temple is completed, the Sthapati prays that the people be 'healthy, wealthy, happy, well known and famous for a long time and that the victorious king protect the whole earth, full of cattle and plants' ('Īśānaśivagurudevapaddhati', IV. Ch. XXXIV. 51).

The relation between a definite type of temple, its patron and architect is illustrated by verses 35-43, Ch. LVI, of the 'Samarāṅgaṇasūtradhāra': "Meru, the Lord of Prāsādas, as described in this chapter must be built by a Kṣatriya only and the architect should be a Vaiśya or he may also be a Brāhmaṇa, versed in Vāstu-śāstra. . . A Kṣatriya, however, though versed in Vāstu-śāstra must by no means be the architect." Re. the King as patron of the Meru, see the inscription, Part V, note 78.

The craftsmen were members of a guild or feudal servants of the king or the chieftain of a temple; cf. Coomaraswamy, 'The Indian Craftsman', 1909, passim.

The "Sarvasiddhi-ācārya", however in an inscription from the Pāpanātha temple at Paṭṭadakal (after 650 A.D.) was not "a guild". Caṭṭara Revāḍi Ovajja, the builder of the Pāpanātha temple was given the title of Sarvasiddhi Ācārya. Another Sūtradhārī, of the southern country, named Guṇḍa, the builder of the Virūpākṣa temple at Paṭṭadakal, was given the title 'Tribhuvana-ācārya', ('Indian Antiquary', Vol. X. pp. 162, 165, 170 where an erroneous translation is given of Sarvasiddhi Ācārya).

The hereditary transmission of architecture is well illustrated by an inscription in the Jagannātharāya temple in Udaipur, Rajputana, of the year 1653 A.D. Its architects, Sūtradhāra Mukunda and his younger brother Bhūdhara, belonged to the family of architects known as Bhangora. Their ancestors came to Mewar from Gujerat, about 1389 A.D. and were the chief architects of the rulers of Mewar since then. This is stated in a record in the possession of their descendant, Bhanvaralal, from where the above account was published in 'Epigraphia Indica', Vol. XXIV, p. 56. To this family of architects also belonged Mandana, who built the Kīrtistambha at Chitor (1440-48 A.D.) and who was the author of the 'Vāsturājavallabha', Rūpamaṇḍana, and other works on architecture and iconography.

The connection of the craftsmen with the temple was not only for the purpose of work on the completion of which the architects received their remuneration and presents, such as gold, etc. (Part VIII, last chapter), or a village ('Ep. Ind.', l.c.). The guilds of the architects (sthapati) and potters, for instance, levied a small cess on every one of their members, working at a particular temple, when a donor intended to make a permanent provision for the maintenance of the temple or the supply of materials for the worship of the deity (Kaman inscr. of about the eighth century; 'Ep. Ind.', XXIV, p. 329).

The Indian craftsmen, it is generally believed, were anonymous. Many however signed their names and some even proclaimed the pride which they took in their work in inscriptions like the one from temple No. 9 in Aihole (Fig. in Part VI) of about the 7th century: "There has not been, and there shall not be in Jambudvīpa any expert (vidvān) in the art of building temples (vāstu-prāsāda) equal to Naraśobha" ('Indian Antiquary', Vol. IX, p. 74, Cousens, 'The Chālukyan Architecture', p. 44).

THE HINDU TEMPLE

great height in one form or another, towards its culminating point, in the earlier of the preserved shrines the roof is also flat. A raised plinth or terrace is a substructure of the body of the temple and frequently accommodates a path of circumambulation. In this its simplest and indispensable form, the Garbhagrha is embedded in thick walls; if it has as is the rule, a high superstructure, it carries upward the architectural theme of the walls from which it arises. Their ever more complex articulation serves as ever more explicit exposition of the meaning of the temple in many figures, each with its name and place in the body of the building.

ARCHITECTURAL ORIGINS

1. CITI, THE ALTAR

Consistent in its completeness and appearance, the Prāsāda is yet not of one origin as is the Vedic altar. Its socle or 'base' (adhiṣṭhāna, pīṭha, etc.), the covered and enclosed chamber (garbha-grha) and its superstructure, the support of the finial, are the three main architectural parts in the vertical direction, each of which refers to a different source⁴³. Yet so thoroughly were these parts amalgamated that they constituted the Hindu temple throughout India for about a millennium and a half in preserved structures; a continuous sequence of forms in the various provinces to which each has given its particular impress, whether in its most imposing monuments or unassuming wayside shrines.

A temple may be approached through one or several, carved and pillared halls, and it may be surrounded by subsidiary shrines and buildings; it may be the centre of an entire temple town, with walls and gate towers, itself of great height and many storeys. Yet the constituent parts of the Prāsāda and its Garbhagrha remain the same⁴⁴.

On the massively packed socle (pīṭha), alike to the altar, the Citi, which is piled on the ground or Vedi, rest the walls (bhitti) of the Garbhagrha. Their lowermost part is also called Vedi or Vedikā⁴⁵. It has a number of horizontal

⁴³ The superstructure, of many origins and the most prominent part of the complete temple, seen historically, is not indispensable. Flat roofs (chādya), however, do not belong to the perfect, i.e., complete, type of a Hindu temple; they show it in its making and are separately dealt with in Vāstuśāstra (see Part VII). Another type of temple, illustrated in the reliefs of Barhut, etc. was known in various types by 100 B.C. approximately. This was an open pillared hall, rectangular or round, with or without a second storey, and always with a sloped roof, either in the shape of a dome, or of a vault, etc. The forms of parts only of this open, pillared temple, built in the main of wood, were integrated in the Hindu temple as represented by preserved structures.

⁴⁴ The small space within the cube of its walls, the Garbhagrha, is the most elementary of the ancient and preserved types of temple, in India. It was used by Hindus and Buddhists in the Gupta Age, as far as monuments exist to-day, and by aboriginals, at any phase of their megalithic or generally pre-historic, non-historic, undated mode of worship. The socle is known as Adhiṣṭhāna in South Indian texts, 'Tantrasamuccaya', I, II, 37; 'Kāśyapaśilpa', X, 1, and as Pīṭha, in the 'Samarāṅgaṇasūtradhāra', LXI. South Indian texts use also the following synonyms: Masūraka, Ādyaṅga, Kuṭṭima, Vastvādhāra (I.P. III, Ch. XXX. 66).

In Orissa, the lowermost part of the wall is called Pābhāga (N. K. Basu, op. cit. p. 184). the foot of the wall. It corresponds to the Vedikā. The socle there is called Pīṣṭha (pīṭha).

The entire structure moreover of certain temples rests on a wide terrace (Kaṭi, Jagati; Pl. I; Part VII, first chart, and note 21) and more than one building may rise from one and the same terrace. Another name of the Jagati is Pīṭhika or Jagati-pīṭha ('Samarāṅgaṇasūtradhāra', LXVIII. 4. and 35). After the planning of the temple, with its ground plan (samsthāna), vertical section (unmāna) and its special architectural form (lakṣaṇāni) the Jagati should be devised correspondingly (cf. ib. 12). Its width is given in proportion to that of the Prāsāda; assuming the latter to be 8 padas it is 28 padas (Ch. LXIX. 41-42) or, in another

mouldings; they continue the theme of the Pīṭha or socle with its horizontal mouldings. Below the socle moreover a sub-socle or pedestal (upapīṭha) is piled in some temples and adds to their height. In these lower parts of the temple, the pedestal, Adhiṣṭhāna, the socle, and the Vedikā is embodied the memory of the sacred ground (vedi) with its piled altar (citi) whence the sacrificial offerings were carried up by the flaming fire. The place of the flame is now taken by the structure on its socle; it arises with perpendicular walls and a pointed superstructure. Neither the form of the socle with its horizontal mouldings nor that of the temple on it imply a derivation from the form of the Agni or its flame; but it is the knowledge of these rites which survives in architectural forms. Even in some of the last buildings in which a living tradition was at work, such as the temple of the Sun at Konārak in Orissa (thirteenth century), or its contemporaries in Mysore or in a twelfth century temple in Rajputana, and in earlier temples in Central India, Rajputana and Gujerat, the memory survives, on the walls of the socle and the Vedikā, of the substance of which the altar was built; wherein had been placed the heads of the sacrificial victims, man, horse, also the Śarabha ('Aitareya Brāhmaṇa', I. 6. 8. 6), and the other 'animals'. It was cemented with a mixture to which these sacrificial animals had contributed. Rites are remembered and, as it were, crystallise in this instance on the surface of the temples in the shapes of men, horse, other animals and the Kīrttimukha, which are carved in horizontal bands around their socle.⁴⁵ The living memory of the Fire Altar however has not only remained at the

instance (ib. 52-53) 32 padas; the width of the outer path for circumambulation (bhrama) of the temple is given as 4 padas.

⁴⁵ As a railing fences in the sacred ground, so does the corresponding portion of the wall (vedi, vedikā) of a structure. In this sense it is an 'enclosing' wall (Coomaraswamy, 'Yakṣas', Pt. I, p. 22). The term Vedi is thus not used for a definite architectural shape; it indicates its relative lower position in the whole structure. It denotes also the lower portion of any vertical unit, such as those of the Bhūmis or storeys; ('Samarāṅgaṇasūtradhāra', LXII; 'Mānasāra', XXII). Vedi is also the name of the highest part of the trunk of a North Indian Śikhara; the superstructure of the temple. In this application the meaning of sacred ground or altar prevails. On this 'High Altar' is placed the finial of the temple (see note 47). The name for the enclosure or enclosing wall around the whole sacred precinct, etc. is Prākāra.

⁴⁶ Adhiṣṭhāna is usually translated as base. If there is an Upapīṭha, the Adhiṣṭhāna is above it; so to be accurate, it cannot be rendered as "base". The word means "a stand" and is translated here as "socle"; the Upapīṭha or pedestal is an optional member of the temple, whereas the Adhiṣṭhāna is an essential part; Orissan shrines however are generally without it.

Two types of figures are to be discerned on the socle, etc. and vedikā; either a row of heads only or of whole figures; the latter are shown in motion, each with its own particular activity and movement. Horses run, men make war, or love, etc.; they are restored to their own sphere of activity in this Samsāra (see Part VIII) at the base of the temple. Memory as embodied in traditional, sacred architecture does not mechanically repeat former contents; they are remoulded with every remembrance. Hence, not only their variety, but also their manifold substitutions. The 'heads' of the various animals are summed up by one kind of head only, that of the Face of Glory, the Kīrttimukha, the Grāsa, for instance on the Devī Jagadambā temple, Khajurāho, etc. In Ramgarh (Kotah State) the following are carved on successive fillets of the socle, in vertical succession: (1) Kīrttimukha, (2) Elephant, (3) Lion, (4) Horse, and (5) Man. In northern Gujerat, the face of the socle (pīṭha) is carved with a series of enrichments of its horizontal fillets: the Grasapaṭṭa, with the head of the Kīrttimukha, in ceaseless repetition; the Gajathara, the elephant course, which is not essentially present; the Aśvathara and Narathara, courses of horses and of men respectively (J. Burgess—H. Cousens,

bottom of the temple, where the Vāstupuruṣamaṇḍala represents its main residue, coterminous as it is actually or in principle with the Vēdi, the total site, or with the extent of the Prāsāda. Reiterated in name, elevated in position and meaning, on a higher level of the temple, once more, the name Vēdi is given to the upper portion of its superstructure, the Śikhara,⁴⁷ on which is placed its crowning part the Āmalaka and then the finial. This Vēdi may be called the Uttara Vēdi of the temple.

On the Vēdi of the site, on the sacrificial ground, the raised 'altar' of the temple, its socle, etc. and Vēdikā, with their mouldings are the firm and horizontal theme and basis from which the building of the temple arises, dedicated as an offering. When this offering is built up and about to reach its end, once more, in a supreme effort, the final offering is made on the high Vēdi, the upper portion of the massive pile of the superstructure; above it are the Āmalaka or the High Temple,⁴⁸ and the finial above these.

The Vedic altar survives in the structure of the body of the temple, in its lowest and its highest part. In technique and name the Prāsāda, the Hindu temple, shares in the name of the Vēdi and Citi. Its total structure moreover, when seen from outside has the appearance of a massive pile, and is a monument more than a building. The thickness of the walls of the Garbhagrha, and the often nearly compact superstructure, also reveal that the entire Prāsāda is a Citi.⁴⁹ This is

'Architectural Antiquities of Northern Gujarat', ASWI. vol. IX. p. 25) ; cf. also the Piṭha of the Someśvara Temple in Kiradu, Mewar, Rajputana, 14th century.

In Thoda, a frieze of Haṃsas is added on the top of the others (ASI. Vol. VI. p. 124) ; Rows of Haṃsas and Makaras are frequent also on the socles of temples in Mysore. The Kīrttimukha or Grāsa and the face of the Śarabha are the same type (see Part VIII). Makara and also Haṃsa belong to the imagery of the Kīrttimukha.

⁴⁷ The Vēdi or Vēdibandha is one quarter of the height of the Śikhara. This refers to the curvilinear Śikhara in the early texts. 'Matsyapurāṇa', CCLXIX. 15-20 ; 'Garuḍa Purāṇa', I. XLVII. 1-5 ; 'Agnipurāṇa', XLII. 17-18 and CIV. Other proportions are given in the 'Matsyapurāṇa', ib. 8-14, and in later texts (Part VII). Vēdi is also the name of the respective portion of a Rekḥa temple in Orissa ; N. K. Bose, 'Canons of Orissan Architecture' p. 92.

⁴⁸ Re. Āmalaka, see Part VIII. Āmalaka is a flattened cogged stone ; Re. the 'High Temple', see Parts VI and VII. The Āmalaka and the cupola (Śikhara) of the High Temple are equivalent 'crowns' of the superstructure. Meaning and origin of the Āmalaka are more complex than that of the High Temple (Vimāna, harṃya). The Āmalaka is generally placed above curvilinear northern Indian Śikharas ; the High Temple (vimāna) above the Bhūmis or storeys of the pyramidal superstructure of South India. The High Temple is a miniature shrine, solid and having a massive domed roof (called "Śikhara") ; it was a domed shrine originally.

⁴⁹ The walls occupy three quarter of the total area of the temple ('Matsyapurāṇa', Ch. CCLXIX, 1 ff.).

In later temples, the walls are built in two shells ; their interior is solidly packed with horizontal blocks of stones, laid in courses (M. M. Ganguli, 'Orissa and Her Remains', p. 145) or the space is filled with loose boulders or dry rubble (H. Cousens, 'Mediaeval Temples of the Dakhan', p. 6), etc. These replace the almost 'cyclopean' walls of the temples preserved from the 4th to the 9th centuries.

No reference is here made to the double walls, with an inner Pradakṣiṇā, Andhakārikā, or ambulatory of the temple type called Sāndhāra ; see Part VII.

In brick temples, the massive superstructure is modified according to structural exigencies. In Gujarati works on architecture, 24 varieties of Śikharas are described built either with a brick core or hollow (Burgess—Cousens, 'Architectural Antiquities of Northern Gujarat', ASWI.,

THE HINDU TEMPLE

confirmed by its very names, Prāsāda, Sadma, Sadanam, derived from or identical to the word Sādanam itself which denotes the piling of the Vedic altar.

It is thus as a Caitya⁵⁰ that the exterior of the temple, the Prāsāda, is proportionate in its measurement (vimāna) and the object of being looked at (darśana).

Vol. IX. p. 2). In its upper part the Sikhara is frequently altogether massive. The massiveness or the degree of the hollowness of the Sikhara and also of the foundation of the terrace on which stands the temple depend upon various technical solutions. Raised platforms built on a cell foundation similar to those at Sirpur, are also below the sixth century temples at Bhitargaon, built of brick, and the stone temples at Deogarh and Nachna Kuthara. The stone Sikhara is built generally by corbelling (kadalikā-karaṇa; 'Tantrasamuccaya', I. II. 47), of courses of cut stone overlapping each other inside, until they meet and close the opening. It is covered by the horizontal plate (skandha) which forms the platform on top of its trunk.

The stones or bricks filling the upper portion of the Sikhara rest on a horizontal tie-plate. It is called 'ratna muda', in Orissa; a lower horizontal tie-plate, the 'garbha muda' forms in some temples the ceiling of the Garbhagrha (Pl. facing p. 120, in N. K. Bose, op. cit., showing the ruined Rekha temple at Telkupi, Manbhūm, with its inner construction laid open). When however the Sikhara is hollow, the Amalaka (śilā) and Kalaśa finial serve to lock the heads of the walls together.

The Sikhara of the Liṅgarāja temple in Bhuvaneśvar, Orissa, has at least one internal chamber above the flat roof of the Garbhagrha. It is accessible by a steep staircase built through the thickness of the sides of the Sikhara; above this internal chamber, which has a window, a third similar chamber is said to exist. (R. D. Banerji, 'History of Orissa', Vol. II. p. 360). These internal spaces have no part in the effect or symbolism of the Prāsāda; they are technical devices for lessening the weight of the superstructure; the same purpose serve the great trabeate arches in the sides of the Sikhara and which are closed up by an 'antefix', the Śukanāsā. See also Part VI, note 65.

The Mahābodhi temple of Bodh-gayā, the temples at Konch and Boram (Bihar) (R. D. Banerji, 'The East Indian School of Mediæval Sculpture', ASI, I. S. 1933; Pls. 83, 85), Parauli, U. P. (ASIAR, 1929-30, Pl. V), etc., have also hollow chambers in the superstructure which differs in plan and section in these buildings. If, as in the Mahābodhi temple, the chamber was accessible from outside, it is a residue of a phase of temple building (Lad Khan Temple, Aihole; Pārvaṭī temple, Nachna Kuthara), where the form of the superstructure had not as yet consolidated.

⁵⁰ Caitya is derived from Citi. A Caitya, in the Buddhist application, with reference to a man-made form, is the Stūpa. The meaning of Caitya, in the 'Mahābhārata', where the country is described full of Caityas and Yūpas (sacrificial posts) is sacrificial altar. The 'Rāmāyaṇa', II. 3. 18; II. 25. 4; II. 71. 47, speaks of Devāyatana and Caitya. Āyatana means a resting place or support and as such a seat, the place of the sacred fire, and also an abode of divinity. The definite sense of 'house' seems conveyed by the word Caityagrha ('Rāmāyaṇa', V. 12. 14); it is commented as 'Buddha-āyatanam' or, acc. to Govindarāja, as a Maṇḍapa of Catuspathas, a hall of Vedic Brāhmaṇas. The Caityaprasāda again which had 100 pillars and was very high, is commented as a Buddhamaṇḍirā and in the latter instance, by Govindarāja, as a building like a Devāyatana. ('Ind. Antiquary', XI. p. 20). Coomaraswamy, 'Yakṣas', Pt. I. pp. 17-27, shows that a Caitya and Āyatana is a 'bhavana', a haunt or abode of a Yakṣa. This can be an altar or a constructed temple, or also a sacred tree, or a tree with an altar.

Medhātithi on 'Manu', IV 39, refers to a structural building, of the type, may be, of the little domed temples as shown in the reliefs of Barhut, etc.

Caitya, Āyatana, Prāsāda, etc., etymologically and originally are piled up seats or altars, sanctuaries in the open and also within an enclosed space.

In certain buildings the massively piled socle of the temple rests on a pedestal or sub-socle (upapiṭha) of considerable height and the walls of the temple are set on a double sub-structure; the socle projects from the Mānasūtra and gives a broad basis to the building.

Hence brick, *Iṣṭakā*, has remained the principal building substance of the temples, for the wooden log or the stone beam is considered and treated as *Iṣṭakā*. It is put to the same use, for the same purpose, as the brick (*iṣṭakā*), which is derived from the radical 'yaj', to sacrifice or to offer and is the original sacrificial substance (Part IV). In this connection it becomes clear why the true arch has not been employed in the *Prāsāda*, nor even in the halls, *Maṇḍapa*, accessory to it.⁵¹ The method of corbelling (*kadalikā-karaṇa*) and the trabeate arch are adjustments of the process of piling, necessitated first of all by the internal chamber, the *Garbhagrha* in the body of the *Prāsāda* and also by the larger halls, added to the *Prāsāda*.

The several mouldings of the socle (*adhiṣṭhāna*) project each in proportion to its own height beyond the *Mānasūtra*, (the side of the wall of the *Prāsāda*, externally). *Jagatī* and *Kumuda* have each a projection equal to their own height, while other profiles, such as *Paṭṭikā*, *Padma*, etc. may project each as much as their own height, or $\frac{3}{4}$, $\frac{1}{2}$, or $\frac{1}{4}$ of it only. This is left to the discretion of the architect ('*Tantrasamuccaya*', I. II. 16). *Jagatī*, in this context, is a projection of the socle, and not the whole terrace on which the temple may be set up (see note 44). *Jagatī* as a part of the *Adhiṣṭhāna* is also dealt with in the '*Vaikhānasāgama*', ch. VI.

In no type of the temple however is the 'citi' as substantially part of the entire conception as in the terrace-temples, excavated in *Pahārpur* in Bengal (c. 8th century, 'Mémorial, ASI, No. 55, p. 7 f), and *Ahicchatra*, near *Rampur*, *Bareilly*, in the United Provinces, dating from the fourth to the tenth and eleventh century (note 117). In these large and spreading brick structures the super-imposed terraces, of which there are three or more, recede successively forming a stepped pyramid from whose centre arose the walls of the shrine.

⁵¹ The true or radiating arch built of *voussoirs* has been employed, although on a restricted scale in various brick buildings only, hitherto excavated; in *Bhitargaon*, *Nalanda* (Monastery, IX. No. 10), *Mirpur Khas*, *Brahmanabad*, the *Mahābodhi* temple in *Bodh-gayā*, etc. in porches, vaults of passages, monastic halls, etc., cf. *Coomaraswamy*, *HIA*, p. 73, n. 4.

2. THE DOLMEN

The ground plan of the Garbhagrha is, as a rule, square, in conformity with the plan, the Vāstumaṇḍala and its division into squares.⁵² The Vedic altar does not account for the square chamber within the Prāsāda. Its walls are as broad as they are long and in principle also as high as they are broad (see Chart, Part VII). A cube forms the sanctuary of certain temples of the Gupta Age; they are located mainly in Central India.⁵³ Their roof is flat, it does not carry a superstructure. Other types of low roofed temples too, of about the same age though different in plan are well known from Western India;⁵⁴ besides, flat roofed temples of the early

⁵² As an elaboration of the square, the outer face of the walls, on the plan of the Prāsāda, shows two varieties of buttress formations. In one case they jut out from the main wall at regular intervals and produce a fretted outline, and in the other, the main buttress of each wall proliferates in one or more further projections; these types resulting in a cross shaped plan. These types are also frequently found in combination.

The rectangular Garbhagrha is an application of the square for definite purposes, when for instance more than one image is the cult object, in temples of the 10 Avatārs of Viṣṇu, such as the now so-called Varāha temple at Kadvar (Cousens, 'Somanātha, and other Mediaeval Temples in Kathiawad', ASI, I.S., vol. XLV; also H.D. Sankalia, 'Archæology of Gujarat', p. 63), or in those of the Mothers (Kapālinī Devi Temple or Vaital Deul, Bhuvaneśwar, Orissa; Navadevi shrine, Jageśvar, Almora, ASIAR. 1928-29, pl. IV.). Other rectangular Garbhagrhas are those of the Temples at Eran (ASI, vol. X. p. 69), Teli-ka mandir, a double square, 30 × 15; (Percy Brown, 'Indian Architecture', p. 152); the Gadarmal temple at Pathari, Bundelkhand, (Cunningham, ASI, vol. VII. pl. 8); also at Gyaraspur. Āyatāśra is the term for 'rectangular'; it means 'with long sides', in the sense of having two parallel sides of the polygon longer than the others; this is a modification of the square plan (caturāśra) just as the Āyatavṛtta, an oval plan, is a modification of the circular or Vṛtta plan (Part VII).

The round Garbhagrha is the general form in the indigenous temples and also occurs in Śiva temples, at Malabar. Gopinatha Rao op. cit., Pt. II. I. p. 91, note, however says that the central shrines of all Śiva temples are square in shape.

⁵³ The term cube is used here to designate a 4-sided prism approximating the shape of a cube. The Buddhist Temple No. 17, Sāñci; Viṣṇu Temple at Eran, near Bhilsa (Percy Brown, op. cit., Pl. XXXIV). Kañkāli Devi Temple at Tigawa, C. P. The temple of Pattaini Devi near Unchahara, C.P. (Cunningham, ASI, vol. IX. p. 31) with its monolithic roof belongs to the 10th or 11th century judging from the carvings of its door frame. The shrines of the Gond, in the Lalitpur District, c. I. (P. C. Mukherji, 'Report on the Antiquities in the District of Lalitpur') are the corresponding ab-original types. The Gond in central India still set up miniature dolmens. Dolmens are also set up to this day by the Khasi, Munda, Oraon, Bhil, Kurumba and Malayarayan. N. Kunjan Pillai, 'The Travancore Census Report', pp. 57-60. "Dolmens have actually been used as Śaivite temples", 'Census of India, Report', 1931, p. 406. Old dolmens are set up as Śiva shrines for example at Kambaduru, Kalyandrug, Anantapur District, see Longhurst, 'Annual Report of the Archæological Survey of India', Southern Circle, 1915-16, p. 29, Pl. III.

The square of the Garbhagrha at Tigawa measures 8', outside the length of the wall is 12½'. Re. the pillared porch, the shape of the architrave and other stylistic features of the flat roofed Gupta temple, see P. Brown, op. cit., p. 55.

⁵⁴ The Lad Khan Temple and Durga Temple, at Aihole; etc. These temples have not an altogether flat roof of one stone slab only nor of beams placed horizontally on the architrave or wall. P. Brown, op. cit., p. 61, Pis. XXXVI-XXXVIII, describes their particular roof

and later Cola period, in South India, though younger in date, the ninth century A.D. and even later, are equally significant.⁵⁵ All these temples are built of large, well cut stones, dressed to level beds and placed one upon another without any mortar or cementing substance. Contrary to current opinion, not only in the Gupta Age in Central India, and in Western India, but also in the South,—for roughly half a millennium,—the flat or low roofed temple preserved its dignity. To this day, moreover, small flat roofed shrines abound in Central India and in South India. The prototype of these shrines is the dolmen with its one large flat slab of stone, supported by three upright slabs set on edge so as to form a small chamber with one side open to serve as an entrance.⁵⁶ It is not by chance that the shrine of Pattainī Devī at Unchahara whose doorway with its cumbrous carvings cannot be earlier than the tenth century and whose architecture is of the 'Gupta type', has a flat roof which is just one slab of stone.⁵⁷

Various phases of stone temples of the dolmen type are to be found in South India; some of roughly hewn stones and with a stone *Līṅga* in the interior, others of carefully dressed slabs of stone accurately fitted at the angles, with their walls resting upon a plinth, about one foot high and not planted on the ground like the

construction. Stone slabs with grooves and corresponding ridges are joined. The joints are covered by long, narrow stones fitted into the grooves; it is a kind of stone-tile roof, slightly sloped, in one or two tiers above which is placed a straight roof covering the middle portion of the building.

The pillared plan of these hall-temples, is square in the one, and apsidal (*hastiprsthā*; cf. note 100) in the other case, far removed from, or not connected with, the ab-original dolmen type.

The flat roofed brick or stone temples, described in the 'Samarāṅgaṇasūtradhāra' in ch. XLIX, and partly also in ch. LII appear to have been similar in type to the Lad Khan temple.

⁵⁵ They are Siva temples at: Tiruvalangudi, Mangudi, Madathukoil, 'Todanjur, etc., in Pudukottai state. JISOA vol. V. See also the large stones of the walls of the Muvarkovil *Vimānas* having high superstructures, at Kodumbalur, ib. Pl. VIII.

⁵⁶ Cf. note 53.

In the Dharwar District, Bijapur, dolmens, not likely to have been used as sepulchral cells were set up on a hill at Aihole, near the temple of Meguti. At Bādāmī, a similar dolmen, consisting of three great slabs set up on edge, forming three sides of a square with a much larger flat slab to form a roof, was used as a shrine for worship. "On the plateau between Bādāmī and Mahā-kūṭeśvar, are to be found hundreds of miniature dolmens, which are daily put up by the women pilgrims to the latter shrine to register their vows. These are composed of a few flat stones, and, as they fall apart, their stones are used over again to build others." H. Cousens, 'The Chālukyan Architecture', ASI, NIS, vol. XLII. p. 138.

To derive the flat roofed structural temple from preceding and contemporary rock cut types as is generally done, is hardly possible. The rock cut shrine has no specific shape. Being a work of sculpture by excavation, any shape can be cut from the mass of the rock, the vaulted type of bamboo origin and the other, the 'dolmen type' with straight wall and roof.

When the flat roofed, square shrines were set up, others were also cut into the rock, and sometimes the two techniques result in one shrine as in the so-called 'False-Cave' in Udayagiri of about or before 400 A.D. (ASI. vol. X. p. 41).

⁵⁷ It measures 7' 8" × 7' 4" (Cunningham, ASI. Rep. IX. p. 36). The flat stone roofs of the other temples are made of rectangular stone slabs, put together, sometimes with overlapping grooves (Tigawa).

wall-stones of a dolmen.⁵⁸ These South Indian examples and the Central Indian Gond temples lead back to the origin of the cubical walls covered by a flat roof in which is enshrined the Garbhagr̥ha.⁵⁹ The flat roofed, 'historical' temple, aggrandised and yet comparatively small, and the ageless, megalithic varieties of village and wayside shrines are of one type. It is this cubical cell which appears transferred at some time, staged and raised on the well packed socle, itself on a terrace in larger temples, and which is finally embodied in the high pile of the Hindu temple with its towering superstructure.⁶⁰ The protracted and widely dis-

⁵⁸ The next stage in the aggrandisement of these temples is described by N. Venkata Ramanayya, 'An Essay on the Origin of the South Indian Temple', Madras 1930, where the two more simple types are also discussed.

As the shrine of Bira-Devaru (ibid. p. 23; Thurston, 'Castes and Tribes', vol. IV. p. 153) shows, the flat roof is supported by four square corner pillars only. Their equivalents, in the shape of pilasters, play their part on the stone-block built Cola temples. Repeated, they flank every niche and articulate the otherwise flat walls (for instance Śiva temple in Mangudi, Kolathur Taluq, Pudukottai). A Pallava rock carved version of this type are the walls (only; not the roof) of the Draupadī Ratha at Mamallapuram.

The wall with pilasters is the result of a combination of two different types of temples. The dolmen type as a rule has plain walls and no pillars. In some instances, however, the large stone slab of the roof is placed on 4 small stones in the 4 corners. S. C. Roy, 'The Mundas', p. 465.

Another kind of flat roofed shrine of 'megalithic' structure is the Śiva temple at Kuttikondabilam, Guntur; its front is composed of large vertical stone slabs.

⁵⁹ An interpretation in the opposite direction does not seem probable. 'Megalithic' village and wayside shrines abound and are set up to this day. The flat roofed temples, have but a relatively large size and their numbers, as preserved from the Gupta, etc. to the Cola age, are not so impressive as to have left a permanent mark on the humble village and wayside chapel to this day. It is not a question of highly significant and evolved types sinking back into folk art, but of perennial types ever ready to have their implicit meaning stated explicitly, by art. An origin in megalithic forms, is also indicated by some of the smaller temples, also at Tigawa of 4' to 6' length, whatever be the shape of their roof; they are apparently built with three sides only, the fourth being open to the East (ASI, vol. I. p. 42).

⁶⁰ The Śiva temple at Kambaduru (note 53) is a dolmen converted to this purpose by a careful dressing and fitting of the stone slabs. They are not planted in the ground but are raised on a moulded plinth.

The circular Prāsāda, as well as the circular Garbhagr̥ha, have their prototypes in the circular shape of some of the Vedic hearths; the Megalithic origin moreover of the circular type of the temple must also be taken into account. Stone circles or their wooden equivalents are also prototypes of the round shape of certain Hindu temples. Megalithic stone circles like the one in Asota off the Mardan-Swabi Road (D. H. Gordon, 'Megalithic stones, Asota', 'Antiquity', Dec. 1939) or one of the stone circles in Deosa, Jaipur, Rajputana (Cunningham, ASI. vol. VI, p. 105), appear to be particularly connected with Vedic numbers by the number of their stones. While these are 21 in Deosa, the Megaliths forming the circle in Asota are 32. The former number (3 × 7) (Ś.B. VII. 1. 1. 13) plays no part in the Hindu temple whereas the 32 surrounding stones of the Gārhapatya hearth correspond in number and function to the 32 Pada devatās of the Vāstumaṇḍala.

The oldest structural temple in Northern India hitherto excavated is the circular temple at Bairat (Virāt) in Jaipur state (ASIAR, 1935-36, pl. XXXIV,; p. 84f.; Cunningham, ASI., vol. I. p. 244; vol. VI. p. 91; Stuart Piggott; I.c. Part IV). This temple, in its original form had an inner circle of 26 octagonal wooden pillars; a circumambulatory enclosed by a brick wall surrounds it. It dates from about the 3-2nd century B.C. It is also a predecessor of the circular Malabar temples, for example at Vaikom, Trikotithanam, and many other places in Travancore, ancient Kerala, etc., built of laterite and wood. (cf. Viṣṇu temple

persed occurrence of the flat roofed temple testifies to simplicities which are perennial in Indian art, which have remained practically unchanged.

The flat roofed temple has the dolmen for its prototype. Like the menhir it marks (cf. the *Liṅga*, which means distinctive sign) a sacred site. Neither dolmen nor menhir are necessarily memorials to the dead, they commemorate the importance of the site which is marked by them. "Kynmaw" which means "to mark with a stone" is the word used by the Khasis in Assam, in connection with monoliths, table stones and cromlechs.⁶¹ There, in the dolmen, a suprasensible presence is confined and enshrined.⁶² The marking of a site (*kṣetra*) shows that it is dedicated to a higher presence. This is a general practice in India, where every orthodox Hindu, every day marks his body (*kṣetra*) with the symbol of the deity on his forehead. The stone dolmen and menhir, and the stone shrine and *Liṅga*, are cognate.

It is seen from the 'Viṣṇudharmottara' and other texts that the science of selecting and testing the stone is most developed where the stone has to be chosen for a *Liṅga*. Stone indeed is the aboriginal substance of the *Liṅga*. Gold and brick are the sacrificial substances of the Vedic altar. Gold, the purest of all substances is not considered in this respect, loses its value and is only given second consideration when a *Liṅga* is to be made. The '*Liṅgapurāṇa*' (ch. XLVII. 5) speaks of a *Liṅga* made of gold and jewels, or of silver or copper, as alternatives

at Perumpalutar, 9th century ; 'Archæol. Dept. Administration Report', 1111 M.E. p. 2). The circular stone walls which the Todas, in the Nilgiris, South India, set up around their Boath and also the Pey temples, Tinnevely Dist., S. India (G. Oppert, 'The Original Inhabitants of India', p. 573), must not be overlooked.

The circular *Prāsāda* and *Garbhagrha* as well as those which are square have their roots in the past of India, in Vedic rites and in aboriginal use in the country.

The '*Satapatha Brāhmaṇa*', XIII. 8. 1. 5 distinguishes between the four cornered (*daiva*) and the round (*āsurya*) sepulchral mound, the square being made by those who know the three Vedas and the circular by the easterners and northerners. These mounds were lined with stone. The rites for the dead have their own place apart from those of sacrifice (*yajña*) and of worship (*pūjā*). The *Śmaśānācī*, the mound for the dead has its definite characteristics ('*Āpastamba Śr. Sūtra*', XXXI. 5. 72).

Form and function of the *Prāsāda* do not owe anything to the rites for the dead or else in a transferred sense and to that extent only in which the sowing of the seeds, or the rites of initiation signify and are based on the knowledge of death, of dying to a former, lesser state and the undergoing a new or second birth to a regenerate life, on a higher level. Temples of Śiva or Durgā are set up on cremation grounds ('*Kathāsaritsāgara*') because in these terrific aspects death is shown as overcome and merged in the deathless.

⁶¹ P. R. T. Gurdon, 'The Khasis', p. 145 ; stones set up to mark the site of purificatory tanks, oath-stones, stones as 'seats' and great flat 'sacrificial' stones, on which *Pūjā* or worship is performed with the offering of rice, etc., are discussed and their specific names given, op. cit., pp. 145-153 ; cf. also note 56.

To this day small shrines are set up by the herdsmen in the Kumaon hills, Western Himālaya (near Binsar, for instance) as Śiva temples and also by the Malayaravans in Travancore. They are put together like a dolmen and house an upright stone, the *Liṅga*. ('*Castes and Tribes of South India*', vol. IV. p. 388-389). From the Himālayas to Cape Comorin the *Liṅga* within the dolmen shrine constitutes the aboriginal temple to this day. Cf. note 53.

⁶² Holding or restraining the presence of the invoked divinity is one of the rites of Hindu worship. It is accompanied by the *Sannirodhinī mudrā* ('*Īśānaśivagurudevapaddhati*', III. ch. XXVII. 104). This purpose, in addition to the marking of the sacred site, is common to the Hindu temple and to the dolmen.

only for the Liṅga made of stone, and which is the embodiment of Brahmā, Viṣṇu and Śiva. Stone, as menhir is specially connected with the Liṅga, and also with the Ādhāraśilā. It marks the Omphalos in the one instance as much as in the other. It distinguishes as the Centre the place where it stands; around it, the site is sacred.⁶³ Thus it is enclosed by square walls and covered with a roof, for as the 'Agni Purāṇa' says "in the square (catvara) Śiva is present".

The memory of the building stones of the temple is retentive. The stones of the walled-in quadrangles which the Gupta shrines are in principle, and also the Cola temples with their added halls, are disproportionately large to the size of the temples.⁶⁴ They form a near substitute of the monolithic walls of the dolmen.

Raised from the earth where it has stood in accordance with the megalithic practice, the flat roofed stone temple on its plinth and terrace, is an established type. The 'Samarāṅgaṇasūtradhāra' has much to say about temples without Śikhara⁶⁵ which were one-storeyed, flat roofed structures. As a rule, however, Vāstuśāstra is preoccupied with the varieties and proportionate measures of Prāsādas having superstructures, and whose height is twice or thrice the width of their walls (Part VII).

The temple with its high superstructure is the ultimate and generally accepted form. Śikhara, of which the meaning is 'mountain peak' designates particularly the superstructure of the North Indian Prāsāda.⁶⁶ The flat roofed temples are contemporary for centuries with temples having Śikhara.⁶⁷ They are at the same

⁶³ The coalescence of such places with others, fully recognised by tradition, is spoken of in passages such as 'Brahmavaivarta Purāṇa', I. 6. 47-48, "a place where the Śivaliṅga is worshipped, though it is a place not fit for pilgrimage, shall be turned into a place of pilgrimage".

⁶⁴ Three courses of stones are equal in height to the shafts of the wall-pillars, in the Cola temples (note 55).—The Maṇḍapam preserved at Mukandwara, Kotah, in Malwa, about the fifth century A.D. is set up of most carefully dressed sand stone blocks of cyclopean size.

⁶⁵ In ch. XLIX, the 'Samarāṅgaṇasūtradhāra' exclusively treats of stone or brick built Prāsādas without Śikhara. They are covered by a Chādyā or a double and triple roof. Chād, even to-day in Bengal denotes the flat roof of a brick structure. These Prāsādas were not dolmen temples; their interiors were rich in pillars (see Part VII).

⁶⁶ N. V. Mallayya, op. cit., JAU., vol. X. p. 181, stresses the meaning 'head' which Śikhara has, derived from Śikhā, the tuft of hair worn by an orthodox Hindu on the crown of the head. Synonyms are Śiras and Śirṣa, both denoting head. This microcosmic reference to the head is no less valid than the macrocosmic one to the Mountain, to Meru, the pole of the world. The full meaning of the Hindu temple is given form by the Prāsāda with its high superstructure; in this sense Śikhara is to be understood and not as a roof which also may be flat (as assumed by Mallayya, JISOA, vol. IX. p. 83, in an article on 'Nāgara, Drāviḍa and Vesara'); see Part VII where the different connotation of Śikhara in the Northern and Southern tradition (śāstra) is explained.

⁶⁷ The flat roofed temples are (1) of the dolmen type, and (2) of the pillared hall type; about the latter the 'Samarāṅgaṇasūtradhāra', in chs. XLIX and LII, gives ample information (see note 65 and Part VII).

Amongst the earliest preserved temples having a superstructure are the stone temple in Deogarh, with an apparently curvilinear Śikhara; one of the four curved sides of a Śikhara, carved in one piece of red stone of Mathurā and belonging to the Gupta age, is in the Curzon Museum, Muttra. The curvilinear surface is divided into three vertical zones; the broad field in the middle is covered with a Gavākṣa pattern; the lateral portions are complete with Bhūmis, each consisting of 2 courses and terminated by a large Āmalaka. The temple in Deogarh and

time embodied within the Prāsāda and below its Śikhara ; in some of the temples of South India, the flat roofed temple with its cubical chamber is repeated vertically within its superstructure.⁶⁸

the brick temple of Bhitargaon are of the sixth century ; the stone temple of Gop, Kathiawar (5th—6th century) has a pyramidal superstructure and, in certain respects similar to it, is the four storeyed pyramidal superstructure of the temple at Visavada, though somewhat later (H. Cousens, 'Somanātha and Other Temples, etc.' ASI. vol. XLV, Pls. XLIII-XLIV, pp. 44-45). A carving on a lintel of the Gupta Age, at Sarnāth shows relief representations of related superstructure ; (Coomaraswamy, 'Early Indian Architecture', 'Eastern Art', III. Fig. 59). The superstructure here is of the rectilinear type, consisting of superposed roof cornice mouldings. It is crowned by a very broad Āmalaka on which rested the finial (Fig. c, in Part VI). The stone built temple of Mahākūṭeśvar, near Bādami, erected in the third part of the 6th century is discussed in Part VI.

Fifth century inscriptions speak of high Śikharas ; ('Corpus Inscriptionum Indicarum', vol. III. No. XVII, verse 21 ; No. XVIII, 12, 30).

What precisely Śikhara and Śṛṅga of the Prāsāda or the Vimāna meant in the Epics except the top of a high building cannot be reconstructed from the respective passages, which compare them to clouds and mountain peaks ('Rām.' II. 17. 17 ; II. 33. 3, etc., see Acharya, 'Dictionary', op. cit., s.v.) The Śuṅga relief representations show vaulted and dome shaped roofs of bamboo construction.

Two relief representations from Mathurā of the Kuṣāṇa age show superstructures whose constituent parts and outline differ from later types and prescriptions. (Coomaraswamy, 'History of Indian and Indonesian Art', Figs. 69, 69A).

The earliest preserved temples which are not one storeyed and flat roofed, are variously given additional height. Two main types can be distinguished ; the one has a second smaller flat roofed temple above the Garbhagrha of the ground floor (Pārvati temple at Nachua Kuthara, C.I. and the Lad Khan temple at Aihole), and the other, described at the beginning of this note, has a more or less pyramidal, etc. superstructure, articulate with horizontal bands, mouldings or storeys. Some were rectilinear such as the temples of Bodh-gayā, Bihar (at the time of Hiuen Tsiang), and the temple at Gop, Kathiawar, others like the Daśavatāra temple at Deogarh and the brick temple at Bhitargaon with their recessed courses appear to have yielded a curvilinear rather than a straight outline. To these may be added the Mahādeva temple at Nachua Kuthara (Progress Report, ASI, Western Circle, 1919) and the temple at Pathari (ASI. vol. X. p. 75) ; see also S. K. Saraswati, 'Temple Architecture in the Gupta Age', JISOA, vol. VIII. p. 146). Re. Vaulted temples, see note 41. The temples are either 'sāndhāra' or 'nirandhāra' with or without a covered circumambulatory.

⁶⁸ The Vāikunṭha Perumal temple for example, at Kāñcīpuram (Conjeeveram, near Madras), of the second decade of the eighth century, cf. sectional drawing, Pl. LIV, P. Brown, op. cit. ; Fergusson, HIEA, vol. I. Fig. 210.

3. THE SHED OF INITIATION AND THE TABERNACLE

The dolmen shape raised on a socle or base (*adhiṣṭhāna*) can be recognised in the flat roofed temple. It remains, however, the nucleus, the sanctuary, of the temples with high superstructures whose walls are rich in buttresses and manifold sculptured images. They always enclose its small cubical inner space, unbroken by any opening, except the entrance.⁶⁹

While the primeval shape of the dolmen is, architecturally, the prototype of the sanctuary enshrined in the Hindu temple, other closed types of sacred buildings also have preceded the Hindu temple. They too, have lent their meaning and added their shape to the cube of the *Garbhagrha*. They are the Vedic shed of initiation and the undatable 'Tabernacle' made of bamboo, or branches or of large palm leaves only, in which a divine presence is known to dwell while being worshipped.

Neither of these structures has contributed its particular form to the sanctuary itself. The shed furnished additional ritual secrecy to the interior of the Hindu temple; the Tabernacle of the forest, similar to the dolmen in this respect, was raised on a socle or altar and while it enclosed the sacred space it marked it by the high shape of four curved branches fixed in the corners of a square and with their ends gathered to a point. Such a conjoining of various shapes and resources to form the Hindu temple is seen not only in its beginning but also in the different phases of its history and in its types (Parts VI and VII). It would result in a compilation, and in the literal sense of the word this is indeed the case, were it not that the congregation of all the available possibilities is to one point only, to the gradual and measured reduction of all the wealth of three dimensional form in one direction, that of ascent, towards a point which is that of the finial above the high superstructure. In this surge of measured units imbued with meaning, the metaphysical aim is supported by principles of vegetation; by growth and ramification, by symmetries and proliferation of form.

The architectural rite of depositing the seed of the temple is continued in the 'natural' discipline of its form which the architect (*Sthapati*, *Kartr*) masters by his aptitude, training and skill. An integration of his personality, that of the patron, the *Kāraka*, and of the shapes of many origins is effected by his work and is visible in its form. Such one-pointedness (*ekāgratā*) is the motive of the Hindu temple with its high superstructure; ostensibly it leads to the one point which is even beyond its own shape. This one-pointedness resulted in the predominance of the temples with the four sided, pyramidal, or curvilinear superstructure over the other temple types, with flat or keel and barrel shaped roofs, etc. (Part VI).

The various Vedic hearths were in the open or in sacrificial sheds.⁷⁰ One of these sheds, the *Sadas*, in which are seated (*sad*) the sacrificer, his wife and the

⁶⁹ Temples having entrances at the cardinal points are however described in *Vāstu Śāstra* and a few have been preserved (see Part V, note 73).

⁷⁰ The *Prācīna Vamśa-śālā* (see p. 23) is outside, to the west of the *Mahāvedi*. *Sāyaṇācārya*, speaks of the *Prācīnavamśa (śālā)* as the womb of the *Dikṣita* ('*Ait. Br.*' I. 3. 11-14, comm.)

priests, is set up on the Mahāvedi. It is covered on all sides with mats and faces the East where is its door.⁷¹ That it is enclosed has a meaning akin in its context, though divergent in its purport from that of the houses, at the time when the trees withdrew from this earth (p. 116). "That Sadas they enclose on all sides with a view to that generation, thinking : Quite secretly shall be carried on that generation, for improper indeed, is the generation which another sees. Therefore to any one looking into the Sadas except through the door, let him say : 'Look not'; for it is as if he were seeing intercourse being carried on. Freely (one may look) through the door, for the door is made by the gods" (Ś.B. IV. 6. 7. 9). It is an act of generation which is performed in the enclosed hut, an initiation which leads to a second birth, in which the initiated is the embryo ('Maitrāyaṇīya Saṃhitā', III. 6. 7) and the hut is the womb ('Taittirīya Saṃhitā', VI. 2. 5. 5).

The enclosed space is a Garbhagrha, a house which is the womb; this is the name of the innermost sanctuary of the temple.⁷² The Garbhagrha is the womb of the higher Self. It is said : "The initiated departs from this place, he goes into foreign land, he ascends to the space of the gods. When enclosing (the hut with mats), (door) openings are made; thus he does not (altogether) leave this place, thus he stays in this world" ('Maitr. Saṃ.', III. 6. 1), for not only to the east but at all the cardinal points, door-openings should be made (Āp. Ś.S. X. 5. 4). This is no final departure but a return to his spiritual home and origin from where the initiated comes back to the world of man. Thus are made "apertures in the four directions for the winning of both the worlds" ('Taitt. Saṃ.', VI 1. 1. 1). Within the hut which faces the East, the sacrificer, the embryo within the womb, also faces the East where the gods live; facing them he beholds them, he is one with them. "The hut is enclosed (on all sides by mats) for the world of the gods is divided from the world of man" (Āp. Ś.S. X. 5. 1).

The secluded interior of the Sadas on the Mahāvedi is a precursor of the Garbhagrha in the Prāsāda on its raised terrace or base; with its main door in the east, and the other, vestigial ones as niches or 'massive doors' (ghanadvāra) at the remaining cardinal points.⁷³

⁷¹ Ś.B. III. 1. 2. 2. (Kāty. VII. 1. 25) ; III. 6. 1. 2. The Sadas is rectangular and may be a double square. Its long side faces the East. Its measures are 18 or 21, 24, 27 cubits and its breadth is one-third (6 cubits), less than one-half, or half of the long side. In the middle of it is the post of Udumbara wood. It has the height of the sacrificer (SBE. vol. XXVI. p. 141). The proportion of its plan 1 : 2 or 1 : 3 recurs in the height of the exterior of the Hindu temple. Here, however, it is the interior which matters most and this has the height of the sacrificer.

⁷² Vedic initiation is performed to-day in the centre of the house, either in a room in the interior of the building or in a specially erected 'pandal' or Maṇḍapam in the centre of the courtyard within the building. The secluded place in the house or in the Maṇḍapam, set aside for the initiation, is called Garbhagrha.

Garbhagrha, in domestic architecture, designates the interior part of the house ('Samar-āṅgaṇa-sūtradhāra', ch. XIX, 27).

⁷³ The temples which are preserved, generally have only one door to the Garbhagrha; the place of the others is taken by 'ghana-dvāras' or massive doors, as they are called. ('Tantrasamuccaya', I. II. 20. comm.). These are niches in the walls of the Prāsāda; the walls of the Garbhagrha, in the interior, as a rule, are plain.

The going from here into another world, that of the gods, is an ascent—and also a descent and a return to the beginning, the Mūla-Prakṛti, the root-evolvent, the dark, non manifest power, receptacle of all there is to be. In this female identity, the Garbhagrha is the womb, the house of the embryo, of the 'avyaktam' that which is not manifested or not yet manifest.

The Vedic shed of initiation, by its scope and also as far as it is constructed on the Mahāvedi precedes, the Garbhagrha of the Hindu temple. Built of wood and mats, it had a pent roof with a ridge; it was without a superstructure.⁷⁴

While the shed of initiation contributed the significance though not the shape of its secluded interior to the meaning of the Garbhagrha, the Tabernacle of bamboos, banana leaves, coconut palm leaves or of bended branches in its primeval form is set up to-day even and encloses a small space where the articles of worship are placed on the seat of the imageless divinity, Satya Nārāyaṇa⁷⁵. The elongated

Extant Prāsādas with four doors are: a Temple at Sinnar; the temple of Siddhanātha, at Mandhata, on the Narmadā; and another in the village at Unkal, Dharwar; re. Jain temples, see Part VII.

Prāsādas with 2 doors, the one opposite to the main entrance are also in the Deccan; the Siddheśvar Temple near Akola (Ahmednagar), another one at Ratanvadi (H. Cousens, 'Mediaeval Temples of the Dakhan', op. cit. p. 53).

In Hindu cave temples of the Deccan, dating from the 7th century onwards, the Garbhagrha in the Dumar Lena at Elura; in the Śiva temple at Elephanta and in the Yogeśvarī cave on Salsette, has four entrances; the surrounding Maṇḍapa can be entered from three sides. The Garbhagrha of Mahādeva's temple of Karusa has three, and that of the Dhokeśvara cave temple, two entrances. (Fergusson-Burgess, 'Cave Temples of India'; Burgess 'Report on the Antiquities in the Bidar and Aurangabad Districts', Pl. XIV).

The rites of entry, purification and worship in the 'pūjāgeha', the house of worship, are described in the 'Īśānaśivagurudevapaddhati', III. ch. XII. 24-109; (transl. St. Kramrisch, JISOA, X. pp. 240-250).

⁷⁴ Gabled or pent roofs over rectangular temples and their equivalent, i.e., conical roofs, single or double over circular temples are the rule in the indigenous wood-stone temples of Malabar, ancient and contemporary. Repeated in tiers, compressed in height, and translated into stone, the pent roof is the unit of the pyramidal superstructure of the Maṇḍapas only, of Orissan temples, and of the Prāsāda itself at Gop, in Kathiawar; re. gabled temples in Kashmir and Nepal, cf. P. Brown, op. cit. Pl. CII. pp. 155-157.

The temple at Gop ends with a crowning shape above a two-storeyed pyramid and horizontal courses of originally overlapping wooden planks; from this background project the Gavākṣas or Candrasālās.

⁷⁵ The designation 'Tabernacle' is used here as an equivalent to house of god ('devāgāra', or 'dev-ghar') which is the name given to this primeval form of the temple by the people who set it up to-day even. The 'dev-ghar' of banana leaves the writer saw being set up and used in the worship of Satya Nārāyaṇa, performed by Malis, gardeners, near Gayā, Bihar.

Its shape when translated into brick or stone facilitates a unification of the perpendicular walls of the Garbhagrha and the superstructure, which is curvilinear. A more or less stilted arch results in the vertical section and the possibilities of its curvature are many (see Part VI).

The survival of the tabernacle of leaves in the worship of Satya Nārāyaṇa, a cult of recent origin, and in other, ancient forms of Pūjā connected with the performances of vows (vrata) is an equivalent, in the sphere of architecture, to certain survivals in the sphere of images. Durgā, the Great Goddess, is worshipped in Bengal by means of an elaborated earthen image of her 10 armed form together with the figures of her attendant divinities. Added to this image is a young banana plant wrapt in red cloth, the Kalabau or Navapatikā. This is the plant symbol of the Great Goddess.

curves of such a structure converge to a point and close their lines to form a house of God. They are the prototype of the temple having a curvilinear Śikhara and were to rise above the Garbhagrha as its superstructure. Four bamboos, etc., or branches fixed at the corners of a square, their stems bended and tied horizontally by withes or strings at regular intervals is its pristine shape.

The Tabernacle consists in all directions of the Arch of Vegetation. The Arch by itself was also set up, made of two branches of Palāśa or Śamī trees ('Āpastamba Śrauta Sūtra'; Part IV). No written record describes the primeval and impermanent houses of God, the spirits and powers.

Another kind of temporary 'house' is set up in Bengal during the spring festival Holi. It is constructed of seven or eight dry, bent bamboos; the ends of each being planted in the ground produce a beehive shape.⁷⁶

Neither the shape of the Tabernacle of leaves, etc. nor that of the 'beehive house' are identical to that of the temple having a curvilinear Śikhara, for the latter is always truncated; its point is divided from its body which terminates with a platform or shoulder-course (skandha); from its centre rises the neck (grīvā, kaṇṭha) on which rests the Āmalaka. Above this is placed the finial of the temple; it leads to the Highest Point.

The central Pillar, the axis of the temple, where it exceeds the bulk of the Prāsāda was given shape in the brick and stone built temples above its curvilinear superstructure; it is its neck (grīvā). The neck, the Āmalaka (Pt. VIII) and the finial (stūpi) are the shapes and symbols of the vertical axis of the temple where it emerges into visibility (Pls. I; XLV).

The Tabernacle was put on top of the flat roofed Prāsāda, or alternatively, the upright, lower part of the Tabernacle was assimilated into the walls of the Garbhagrha. The meaning of this prototypal shape is not given in scripture; it is shown in the curvilinear shape of the high superstructure of the majority of mediæval Hindu temples built in brick or stone; its form remains nearer to its origin, when, built of bamboo or wood it is carried on the wheels of the temple chariots. The temple chariot is neither a copy of the temple nor is it its model. The temple is the stationary (sthira) form, the chariot is the movable (cala) form of the seat and house of god, the Tabernacle. The same distinction applies to the image; it is either immovable, the Dhruvabera, permanently fixed in the Garbhagrha, or it is movable (cala) and carried about in procession. Both these varieties of the Tabernacle and the image express the two-fold nature of divinity, who as Pure Principle, Śiva, is immovable and has an immovable seat (acalāsana), and as Śakti, Energy, is movement itself and is therefore enthroned on a movable

⁷⁶ It houses an effigy made of rice paste of the Old Woman, which is worshipped by the priest. Then the house of the Old Woman (buḍirghar) and the effigy are burnt to ashes which are magically effective.

I am indebted for this information to Sudhir R. Das.

A peculiar brick (?) structure of elongated-beehive outline and with a Gavākṣa, carved on its lower part, is represented in a relief from Amarāvati (First Period); cf. C. Sivaramamurti, 'Amarāvati Sculptures in the Madras Museum', Pl. XVI. The Gavākṣa is surmounted by a very tall finial of several components (Āmalaka (?), etc.).

THE HINDU TEMPLE

seat (calāsana).⁷⁷ This two-fold aspect of divinity has its corresponding rites, images and architectural forms such as the Prāsāda, its seat, and the chariot (yāna), its vehicle.

⁷⁷ 'Īśānaśivagurudevapaddhati', III, ch. XXVI. 73 f.

T. A. Gopinatha Rao, 'Elements of Hindu Iconography', vol. I. Introduction, p. 17. There are also 'calācala' images, which as a rule immovable, may yet be taken in procession in certain rites.

Chariots of Jagannātha are drawn in procession during the car festival, Ratha-Yātrā, annually; in Bengal they are constructed of bended branches, etc. and resemble the 'dev-ghar' (note 75).

THE IMAGE OF "THE MOUNTAIN AND THE CAVERN"

(A) THE GARBHAGRHA

Meru, Mandara and Kailāsa are the first three names amongst the twenty types of temples described in the early texts, the 'Bṛhat Samhitā' and the 'Matsya Purāṇa'; all three are the names of the Mountain, which is the axis of the world; that is Meru, the pole of this earth; Mandara as churning rod, planted on Viṣṇu, the tortoise, during the Satya Yuga, the first world age after the great commotion; and Kailāsa, as seat of Śiva, in the Himālaya. In these names rises the temple, the image, aim and destination of this world edifice.⁷⁸

To serve this image, various architectural forms such as the curvilinear Tabernacle having paraboloid lateral surfaces, the pyramid, dome and roof shapes, are employed. Their possibilities are exploited and yield a monumental unit. Their forms are developed logically; they are, moreover combined and indefinitely varied.

There is no equivalent term in Western architecture to fit the high shape of the Hindu temple, its superstructure. This superstructure has the height of a spire, and fulfils the function of a roof. Its verticality is unobstructed by any horizontal roof line. If halls (maṇḍapa) are added to the Prāsāda, their high roofs ascend in relatively lower peaks, graded in height and isolated the one from the

⁷⁸ Bṛ. S. LV. 17 f., 'Matsyapurāṇa', CCLXIX, 28 f. Inscriptions extol eloquently and unceasingly, the temple as the Mountain. The Mandasor inscription of the temple of Sūrya built in 437—438 A.D. describes it with its broad and lofty spires resembling a mountain; 'Corpus Inscriptionum Indicarum', III. p. 83. This temple was repaired in 473-74 A.D. and then described as temple of Sūrya, which touches the sky, as it were with its beautiful Sikhara (Indian Antiquary, XV. p. 196). The Gaṅgādhara stone inscription of Viśva-varman in Jhalawar, Mālva, speaks of a temple of Viṣṇu (Viṣṇu-sthāna) resembling the lofty peak of Kailāsa ('Corp. Insc. Ind.', III. p. 44) which is Śiva's mountain, but is referred to as representing the World Mountain. The Hansot Plates of Cahamāna Bhartrivaddha (Broach: 756 A.D.; 'Ep. Ind.', vol. XII. p. 203) designate Meru as Jayādhāra, support of Jaya, the Sun (see Part VIII. ch. 'Āmalaka'). According to the 'Prabandhacintāmaṇi', King Karna of Gujerat constructed the Karpameru-prāsāda in Anhilwad, the name of the king being linked with the temple type Meru. Meru is the 'king of Prāsādas' ('Samarāṅgaṇa-sūtradhāra', LV. 3).

In Vijayasena's inscription at Deopārā ('Ep. Ind.' I. pp. 310, 314; P. Mus, op. cit., p. 413; Inscr. of Bengal, vol. III), the high temple of Pradyumneśvara is compared to the (central) Mountain on which rests the sun at midday, and this is the only Mountain worth mention among all the mountains.

The temple as the Mountain is not only so described in the inscriptions, etc. The Pārvaṭi temple at Nachna Kuthara (ASI. vol. XXI. p. 95) has the outer faces of its walls covered with carved rock shapes—a none too satisfactory experiment in form. The final shape of all these 'mountain peaks' is the Śikhara-cluster (Part VI).—In the geography of the Purāṇas, Mandara is the mountain east of Meru ('Viṣṇu-P.' II. ch. II. 17); it can be imagined as its eastern Ūroṣṇga. Kailāsa, the abode of Śiva or of Kuvera, is situated to the north of Mt. Meru, or it is said to be one of its three peaks ('Siddhānta-śiromaṇi', II. III. 36), so that either of these peaks, Mandara and Kailāsa, is a part of Meru.

next.⁷⁹ The steep ascent of the superstructure from the walls of the Prāsāda then appears integrated in a slower approach, along a sky line rising with triangular indentations, towards the main Śikhara (Pl. I.). The towering superstructure, the Śikhara, moreover forms one monumental unit with the perpendicular walls which support it and from where it rises to the high point of its finial. A series of mouldings and recesses of the pedestal and socle (upapīṭha and adhiṣṭhāna) of the Prāsāda lead in stepped and curved, slanting profiles to its wall rich in corresponding mouldings (vedikā or 'pābhāga' and the crowning mouldings) whence spring the ascending curves (rekhā) of the Śikhara (Pl. XLIII); the complete Prāsāda has the form of an unbroken ascent from the base to the finial.⁸⁰ Within it and below the superstructure⁸¹ is the Garbhagrha, the 'womb of the house' a small chamber, square, in the majority of preserved temples, and dark as a cave in a mountain. It is the innermost sanctuary of the Vimāna, and the entire temple.

In its interior it has four plain walls. They are massive and their continuity is broken only by the entrance in the front wall.⁸² There is no other source of light. If the door is closed, the interior is dark. In the larger temples, where one or several halls precede the sanctuary, the image is but faintly lit by the light of day as it reaches it across the hall, a dim light just sufficient to set off the image against the darkness of its chamber; the darkness deepens towards the corners even though oil lamps may illumine the image during ritual worship (pūjā). Darkness too, descends on the image from the top of the cell, in the belly of the tower. The limits of the Garbhagrha, the sanctuary, are more felt than seen, though even in the largest temples it remains in actual dimensions a chamber of small size, here surrounded as it is by two sets of walls and with spacious halls leading towards it⁸³ it appears proportionately smaller than in temples of lesser dimensions.

⁷⁹ This refers to the majority of Indian temples with their curvilinear Śikhara. The Maṇḍapa should not exceed in height the Sukanāsā of the Śikhara of the Prāsāda. The Sukanāsā, at different stages of the evolution of the Śikhara, reaches up to half of its height or less than that (Part VII, note 35).

⁸⁰ This is not so in South India. There, the cube or the four sided prism of the walls, and the pyramid of the Bhūmis or storeys forming the superstructure are sharp in their distinctiveness and retain the outline of a drawing of the Tetraktys; an analogous form, pyramid on cube, is the rule in the structure of the Maṇḍapa in Orissa. In its vertical section moreover it does not coalesce with the Prāsāda into one comprehensive unit, but retains its integrity as a counterplay in the design of the whole. This is expressed by local tradition which considers the shape of the Maṇḍapa as female and that of the Prāsāda as male; while the 'Bhuvanapradīpa', XLII, l.c., speaks only of the 'gainthiāla', the 'marriage knot', between Prāsāda and Maṇḍapa.

⁸¹ In some South Indian temples, the first Garbhagrha is on the ground floor, and a second, third and fourth Garbhagrha on each successive floor of the pyramidal superstructure (note 68). In earlier temples such as the Pārvaṭī Temple at Nachna Kuthara, C.I., ('ASI. Western Circle, Progress Report', 1919, pls. XV, XVIa) of Gupta age, a 'replica' of the flat roofed, one storeyed temple is placed on its roof. The two Garbhagrhas, one above the other stand up in the shape of a high four sided tower, its upper half in which is the higher Garbhagrha emerges above the walls and roof of its ambulatory (andhakārikā). cf. also the temple at Gop, the shape of the inner walls.

⁸² See however note 73.

⁸³ The length of the Garbhagrha is about 12' ; the length of the total building with its Maṇḍapas is 102' 3", in the Kandariya Temple in Khajuraho; (B. L. Dhama, 'A Guide

The square of the ground plan, the interior of the sanctuary, the small cubicle filled with darkness extended into the mass of the Prāsāda, and its towering superstructure, or the Śikhara, which rises from the beam or architrave (uttara) of its walls; these are the surroundings of image or symbol. This is the place towards which the devotee proceeds where worship is offered. This nucleus remains, poor, undisguised yet hidden, the place where dwells the Supreme Principle, as God, Īśvara, in the consecrated image or symbol.

It is independent of time and place, a cavity held by primary elements of architecture and their relationship. With them an adequate space is enclosed for the purpose of ultimate realisation. This secluded spot is called Garbhagrha. The name refers also to the human body and to the inception of life. By its name and form the Garbhagrha is a place of primary significance; it does not date, is as old as the Hindu temple, and constitutes its essential part as much today as ever it did. The name of the Garbhagrha is not, however, intrinsically connected with its form. Both are symbols and each stands for an aspect of the same reality. The name and form of the Garbhagrha do not coincide on the plane of things seen. They coincide in their destination. The Garbhagrha is not only the house of the Germ or embryo of the Temple as Puruṣa; it refers to man who comes to the Centre and attains his new birth in its darkness. The Garbhagrha is Rahasya, secret and mysterious (Cidambaram).

The form of the Garbhagrha is based on a square and this makes permissible the use of the designation temple. The Romans called 'templum' a square fenced off for augury. Within such a preserve the outside influences are excluded. The cubical chamber of the Garbhagrha is replete with static order. It stands firm. This must be so in a sanctuary, a place for the realisation of the Supreme Principle which is infinite and beyond all limits. The world in which we live is indefinite in extent and open on all sides to question and uncertainty; within limits, number and measure is the Garbhagrha. Like the city of Brahman (Brahmapura) it rests within its four walls ('Maitrāyaṇī Upaniṣad', VI. 28; 38). Their thickness shuts off the outer world and keeps secret the interior. Its sacredness is protected from the evil influence of external distractions and from the destructive agents of time and accidents. The greatest possible lastingness is secured for the secluded place in which dwells the eternal present during Pūjā.

Garbha which signifies the womb as well as the embryo in the microcosmic sense, denotes Prakṛti, primordial Substance, in its macrocosmic application. The name of the innermost sanctuary does not primarily designate it as the house of God; it refers to a state or degree of manifestation. The manifested world, ontologically exists by increasing condensation: ether, air, fire, water and earth, the subsequent element always retaining the qualities of the preceding ones. Four elements: air, fire, water and earth can be touched, seen, tasted and smelt; they proceed in ever increasing density from the first element, ether (ākāśa). It is perceived by hearing. Sound (śabda) is the quality of ether (ākāśa), the first and foremost of the elements in the process of manifestation. In the beginning was the Word.

to Khajuraho', p. 9; see Fig. in Part VI); as a rule, the width of the Garbhagrha is half of the width of the Prāsāda, but here, the exceptions are many (see Part VII).

Similarly also within the Garbhagrha is the image or symbol of wood or stone or crystal or it may itself consist of ether, as the Ākāśa-līṅga in Cidambaram. For in the inner ether, (ākāśa), circumscribed by the city of Brahman (Brahmapura) is contained all that is. "In this city of Brahman is a small lotus, a dwelling in which is a small cavity occupied by ether (ākāśa). That which lies in this place should be thought after and one will know it."⁸⁴ "As large as is this Ākāśa so large is that Ākāśa in the heart. Both heaven and earth are contained within it; both fire and air, both the sun and the moon, the lightning and the stars, and whatever there is in this world, and also what is not,—all that is contained within it."⁸⁵ This city of Brahman, is the body;⁸⁶ the small cavity of the heart, the centre of being in man, is the place of the small ether. This place of Brahman, in the heart of man, has its analogy in the Brahmasthāna, in the centre of the temple maṇḍala or plan, where also lies the heart of the Vāstupuruṣa.⁸⁷ This centre of the temple plan, has its equivalent in the Garbhagrha where it does not coincide with it.

Ākāśa which is prior, ontologically, to the other elements and not perceptible by any other sense except hearing, is the element which corresponds to Prakṛti, primordial substance, out of which evolves all that is manifest. Ether fills everything, it is all pervading. It is in the air and it is in the stone. It is housed within the four walls and there it extends in all the six directions, east, west, north and south, to the walls, across them and also below and above, into the foundation of the temple and the height of its superstructure. Ākāśa, ether, corresponds to the primordial substance Prakṛti, in the process of manifestation. It is the first departure into manifestation from the unchanging Pure Principle or Essence, into ever more concrete substance. This departure or transformation, while taking form and shape takes place literally, across the walls which bound it. From the 'point of view', or the centre of the Garbhagrha, the walls around it while sheltering it, are held together by the Essence and formed by it in every buttress, profile and figure. On its outside, the mass of the temple is seen to give full exposition, in the light of day to the meaning enshrined in darkness within.

"In the beginning this Universe existed in the shape of darkness" (tamo-bhūtam; 'Manu Smṛti', I. 5). "In the beginning (of creation) there was darkness hidden in Darkness" (RV. X. 129. 3; 'Taitt. Br.', II. 8. 9. 4). The darkness in the Garbhagrha is a necessary condition for the transformation which is wrought in the devotee. In darkness his change is effected and a new life is attained. The rite of Garbhādhāna had to be performed at night and also those which preceded the felling of the tree. If then the light is waved in front of the image, this illumination is an act of recognition of the God in the potent, superluminous darkness, revealed now and known further in all the images outside on the walls of the temple, of the many gods, the Devas, the shining ones, in the light of day. The effulgence, the images of the gods, which are carved on the walls and set into their niches is

⁸⁵ 'Chāndogya Upaniṣad', VIII. 1. 3. The 'small ether' is the 'gati', the path and origin of everything. 'Vedānta Sūtra', I. 3. 15.

⁸⁶ 'Sāṅkara Bhāṣya ; Chānd. Up.', VIII. 1. 5.

⁸⁷ The Brahma-sthāna is the place of God Brahmā the deific name and form of the Brahman, the Supreme Principle.

the splendour of the Hiranyagarbha, the Golden Germ, the light which shines from the primordial Darkness. It shines from the superluminous darkness of the Garbhagrha across the walls and is seen in front of the 'ghanadvāras', the niches; their actual designation is "massive doors". Nobody can pass across them. They are irradiated from within. Through them the splendour of the Hiranyagarbha appears translated into the form of the figure of the god in each of the niches around the body of the temple. In other words, and on the 'plan', the Vāstumāṇḍala, the suns of all times are around the Brahmasthāna and in the outer border of the square, are the regents of the moon and the stars.

Close to the small dark space, within the mass of the Prāsāda and above which it rises with its superstructure, is laid the Garbha, to the right of the door (p. 126), immured within its walls. These are the manifested substance of the indwelling Essence in the Garbhagrha. The Essence leaves its impress on the walls in the four directions and the intermediate regions of space; charged with it, the walls are shaped by its impact.

The temple is the concrete shape (mūrti) of the Essence; as such it is the residence and vesture of God. The masonry is the sheath (kośa) and body. The temple is the monument of manifestation. The devotee who comes to the temple, to look at it, does so as a 'seer', not as a spectator.

Ritual action and architectural form express one and the same meaning. The structure of the temple accompanies, follows and translates into a relative permanence the rites and their rhythmic formulae (mantra). The rite for the elevation of the Temple is the Garbhādhāna, the insemination of the site with the 'seed' of the temple.

The seed is deposited at night in the womb of mother Earth, as Garbha, Germ of the temple, close to the door jamb of the Garbhagrha.⁸⁸ In the vertical, in the upward direction, which is that of growth, from below, along the jamb of the door and above it, the power of germination lifts as it were the lid of the Garbhagrha, and transcends the flat ceiling of the Garbhagrha, step by step, level by level in ever diminishing tiers to the top of the superstructure; there once again it rests and is level as the Skandha (shoulder course) before it attains its crown and is surmounted by its finial.

The Garbhagrha is the nucleus of an all sided increase on the outside, in the horizontal, a stepping forth from the dark interior into expanding bulk and multiplicity of form and meaning. Its outward impact within its walls is traversed in the vertical direction by the urge of growth which corresponds to the sprouting of the seed, and leads from the broad earth and the base of the temple towards its high point even above the superstructure. A synonym for Śikhara, the curvilinear superstructure, is the term Mañjarī which means a shoot. This refers to the form of the superstructure as much as it follows logically by way of natural symbolism from the rite of Garbhādhāna. The vivifying Germ (garbha) and the Embryo of splendour (Hiranyagarbha) are within the walls of the Garbhagrha and have their images in the construction of the temple.

⁸⁸ Part IV.

(B) THE SUPERPOSITION OF SHAPES ALONG THE VERTICAL AXIS

The images which are given concrete form in the building of the temple have been seen and worded in revelation (śruti) and the sacred tradition (smṛti).

The Hindu temple is a synthesis of many symbols. By their superposition, repetition, proliferation and amalgamation, its total meaning is formed ever anew. In the vertical direction, the superposition of forms leads towards the culminating point. The solid socle or base (Adhiṣṭhāna, etc.) functions as the altar on which the offering is made in the shape of the temple. Its main part is the walled in, dark space of the Garbhagrha. From the vertical walls of the Garbhagrha, the original dolmen shape, rises the superstructure and above it, the finial. The high superstructure is not derived from any particular roof shape; these, in certain types are embodied in its form. It is not a roof with increased height; it is a form of sacred architecture, complete in itself and is placed above the walls of the Garbhagrha⁸⁹.

⁸⁹ Generally, the pyramid of the South Indian temples is super-added to its straight walls.

The survival of the dolmen type in flat roofed temples of the mediaeval period—such as those near Jhansi (central India), at Candpur, Dudahi and Ladhaura (ASI, U. P. Photographs, 1937-38, Nos. 6785, 6758, 6763) has been pointed out already. The Megalithic 'signature' of these flat roofed temples is shown by the roof where it consists of one monolithic slab. In certain flat roofed temples, moreover, the front is composed of large, vertical stone slabs (Śiva temple in Kuttikondabilam, Guntur; ASI, Madras Photographs 1936-7, No. 328).

The height of the storeys (bhūmi) of the pyramidal superstructure diminishes, on certain temples, in an arithmetical progression; each successive storey is $\frac{1}{4}$ or also $\frac{1}{5}$ less than the lower. In this progression however is not included the ground floor (samsthāna) of the temple. In order to moderate the abrupt superposition of the pyramid with its miniature storeys on the relatively high wall of the 'cubical' Garbhagrha, this wall frequently appears divided externally in two storeys, each complete with its base, pillars, capitals and roof cornice. This architectural consideration belongs to the Cola age (Temples at Tanjore, 1000 A.D.; Gangaikonda Colapuram about 1025 A.D.); and while later temples show an increase in the number of simulated storeys on the walls of the Garbhagrha (Temple at Tiruvarur, about 1600 A.D.), Pallava temples are free from this aesthetic deceit (Shore temple at Mamallapuram, Kailāsanātha temple at Kāñcīpuram (650-700 A.D. approximately). See Plates LI-LIII; LVII-LIX in P. Brown, 'Indian Architecture' and Part VI.

The superposition of the pyramidal, storeyed form on the vertical walls of the Garbhagrha, though generally is not necessarily always observed. The pyramidal structure of the Vaikunṭha Perumal Temple (ib. Pl. LIV) rises directly from its socle. Here too, the storeys are not simulated, miniature replicas; they house a Garbhagrha on each floor. In the majority however, of the temples in South India, including the Kanarese country, a complete structural pyramid of this type, appears raised on the Samsthāna, the groundfloor or one storeyed temple. This development appears already completed in the seventh century rock cut temple models which an ingenious king (Narasimhavarman) was pleased to have cut out of the rocky boulders near the shore of Mamallapuram.

The diminution of the height of the Bhūmis of the superstructure of a South Indian temple is carried out according to more than one consideration, such as the number of these 'storeys', etc. (see Part VII, Chap. 5).

In Northern India, the diminution of the Bhūmis of a curvilinear superstructure such as the Sikhara of an Orissan temple does not form a series; if, for example, there are ten Bhūmis, of

Above the superstructure and no longer part of the body of the temple, is the finial or Stūpikā; it is however proportionately related to the body. All these shapes are piled one upon the next, along the vertical axis. It connects the central point of the floor of the Garbhagrha with the high point of the finial.

On this vertical axis are threaded the levels of the building, its floors (bhūmi) and profiles, their projections and recesses. Expansion proceeds from the central point of the Garbhagrha, in the horizontal, in all the directions of space; this spread with its proliferation and particularisation is gathered up towards the apex; the broad mass with its many forms is reduced to a point, beyond its total form.

The piled up altar, the base, the dolmen-cell, the Garbhagrha, and the superstructure are the architectural constituents of the whole image of the temple; it rises like a mountain. Its mass diminishes while it is drawn along the vertical to a high point, straight above the centre in the dark small space of the interior. The image of the mountain and the cave is known in nature, and is given form by the architect. This total aspect of the temple is not in continuation of an extant architectural type like its parts, the altar, the dolmen, the Tabernacle and the other constituents of its superstructure. It preserves however as they do, the memory of a cult, the cult of caverns; and this corresponds moreover to the immediate realisation of the cavity of the heart. These are immediate symbols in nature and in man; to this day the Himālayas are full of natural caves, small or large, and sacred.

The cave temples are an elaboration of these primeval sites. No architectural forms however were evolved there; on the contrary, forms of structural buildings were adjusted to the exigencies of the rock, pillars for instance increasing in

which the lowermost has 5 units, the height of the following is: $4 \frac{7}{16}$; 4; $3 \frac{15}{16}$; $3 \frac{3}{4}$; $3 \frac{9}{16}$; $3 \frac{7}{16}$; $3 \frac{5}{12}$ and 2. ('Canons of Orissan Architecture', op. cit. p. III).

No diminution however in a geometrical progression can be seen, as stated by M. M. Ganguli, 'Orissa and Her Remains', p. 128, on the accompanying Plate II.

Apart from the main types of the superstructure and their several components (see Part VI) efforts are documented in the centuries around the beginning of the present era, of superimposing and combining buildings along the vertical axis.

An ancient type of temple consisting of two super-added buildings is shown on the reverse of Audumbara Copper Coins (Fig. 16, Pl. I of J. N. Banerjea, 'The Development of Hindu Iconography'). The lower part of the structure has a sloped roof, above it is placed a smaller structure which also has a sloped roof. This type of a Śiva temple, of the second to first centuries B.C. in the Panjab, in the superposition of structures, resembled Bengal temple types (Gauriya) of the present day, in Bengal and Orissa. Their roofs are sloped and curvilinear. Buildings of these and similar types preceded, and contributed to, the formation of the superstructure of the temple (Part VI).

Another ancient form of the temple is represented in Barhut, about 100 B.C. and in Mathurā in the second century A.D. (Coomaraswamy, 'HIIA', Figs. 42 and 70). In these reliefs a small, domed shrine is encased in another structure which is roofed by a series of superposed 'slabs' of increasing width, the topmost forming a flat and crenellated roof. This method of superposition and encasement though it is neither represented by any of the later temples nor mentioned in Vāstu-śāstra, corresponds to the vision of the Throne of Supreme Blessedness on the Brahmānanda mountain (Śrī Svami Hariharanand Sarasvatī, 'Viṣṇu, The All-Pervading Principle', JISOA, XII. p. 154).

Re the various combinations contemporary with the main types of the superstructures, which were not destined to become leading types, see, for example, p. 169, note 94.

width so as to support the weight of the hill which in part rested on them. Layana, place of rest, is the name for rock cut temples. They have no Śreṇi, which means no superstructure with its cluster groups of similar shapes; they are without buttresses (niryūhaka), while a circumambulatory (bhrama) and windows (gavākṣa) should be carved in the rock ('Samarāṅgaṇasūtradhāra', LIX. 236-237)⁹⁰ in imitation of structural temples.

Symbols such as the vertical axis or pillar along which the varied forms are threaded on different levels or the cave in the mountain, and architectural forms such as the convergence of ascending lines which connect the perimeter of the building with the end of its vertical axis, or the various shapes of the superstructure, these and other images and forms constitute the symbolical and concrete structure of the temple. The temple under the name of mountain resembling it by its peaked form, is always the One Mountain, an image of manifestation in its hierarchy along the central axis of being. This axis passes through all the strata of existence, and shows them linked to the highest point, at different levels⁹¹. From the highest point the line passes in the centre and pierces the ground in the middle of the Garbhagrha where the Liṅga or image is. From the perimeter of the Prāsāda towards its highest point rises the bulk of the building, a vesture of the central axis; in its folds and throughout its extent, it is an exposition of the total meaning of the temple in the particular application to each single spot.

The names of the three first temple types recorded in the early texts are those of the Mountain; Meru, Mandara, Kailāsa; another type among the twenty temples

⁹⁰ The Layana is equipped moreover with stairs, a gateway (pratoli), roll cornice (vitaṅka = kapota-pālikā) on the façade, and doors. It is raised on a socle (vedi) and has a portico (prāgrīva). This description refers only to cave temples such as those in Bādami. The cave temples, in the earlier examples (3rd century B.C.—6th century A.D.) are interiors only, having a façade; to these types were added (Mamallapuram, Elura, Kalugumalai), complete replicas of structural temples hewn out of the rock in their exterior, and excavated within (Kailāsanātha Temple and Indrasabhā in Elura). Although the last named temples are, the one Hindu, the other Jain, the majority of the rock cut temples and sacred abodes are Buddhist. Out of a total of 1200 rock cut temples 900 are Buddhist, 200 are Jain and 100 are Hindu. Some of the sanctuaries in Elura (Daśavatāra, etc.) and the Śiva temple in Elephanta are, though posterior to the sixth century, interior excavations only with a façade. Re. these, and later excavations in Northern India—at Dhamnar (Rajputana) and Masrur (Kangra) see P. Brown, 'Indian Architecture', (Buddhist and Hindu), Chapters V, VI, XII and XI.

The square, dark, small Garbhagrha is not transferred from the cave temple to the structural temple. The flat roofed 'Gupta' temple is not derived from Brāhmaṇical excavated sanctuaries contemporary with it (Udayagiri in Bhopal, etc.), nor from earlier excavated cells with a flat ceiling; the early rock cut sanctuaries have domed or vaulted interiors, whereas cells and halls in the rock cut monasteries have a straight ceiling. There is no scope for a flat roof in rock cut temples, the Caitya halls prior to the Gupta age; it belongs to the flat roofed porch only of the sanctuary proper. The flat roof of the rock cut Kailāsanātha Temple in Elura of the eighth century is in imitation of a structural temple of that age.

Any shape can be cut into the rock; no structural form is born there.

⁹¹ René Guénon, in 'Le Symbolisme de la Croix' and other works has made clear the meaning of these and other symbols; A. K. Coomaraswamy has explained them in their application in art. P. Mus has interpreted the Barabudūr in the aspect of these perennial symbols.

In the 'terrace temples' at Ahicchatra, etc., the axis or shaft cuts across the terraces; the shrine, in continuation of the shaft, rises from the highest terrace.

described in the 'Br̥hat Saṃhitā' is called Guharāja, King of caves (LV. 17)⁹²; it is equally telling by its name as the four last named types, in chapter LV of the 'Br̥hat Saṃhitā', the Round, the Square, the Octagonal and the Sixteen sided one are by their form, which should be dark inside, "so that light from outside will not enter these Prāsādas" ('Br. Saṃh.' LV. 25; 28, with comm.).

Guharāja, King of caves, is a name as suggestive as it is unique among the ever-increasing types of temples enumerated and described in the texts⁹³. The name however occurs also as that of actual temples, such as the 'Kuraja (Guharāja) Bir' Temple⁹⁴. Kuhara, or cave, is a synonym of Śālā, or room, in the 'Bhaviṣya Purāṇa', where the type of temple, called Meru, is described as having many Kuharas (ch. CXXX. 27)⁹⁵.

The language of the texts connects the mountain and the cave while describing works of architecture, or forms of nature and also the residences of different classes of gods, Devas and Dānavas, Pannāgas, Yakṣas, Rākṣasas, Guhyas, Gandharvas, Vidyādharas, Siddhas, Kinnaras and Apsarās who live in Indra's grove on mount Sitānta full of rock and cave-houses⁹⁶. The 'Vāyu Purāṇa' tells of the various kinds of residences of the gods on the different mountains⁹⁷. It is a topography of the mountains where the gods reside and of their habitations on an Olympus with many peaks⁹⁸; it is not a description of temples built by man on mountain tops for the gods to dwell in.

The caves are ancient residences of the gods. It is there too, and not only on the banks of rivers that they love to dwell; their presence there is felt so strongly that cave and god are one; "on the Viśākha mountain there is a great dwelling belonging to Guha, the Secret one (Kārttikeya), the god who is very fond of living in caves" (guhā; 'Vāyu Purāṇa', XXXIX. 55). To these natural habitations of

⁹² 'Bhaviṣya Purāṇa', CXXX. 32 which derives from the Br. S., or from a source common to both, substitutes Gṛharāja for Guharāja, see Part VII, 2nd chart (cf. also S.S. Ch. XLIX. 16; 160).

⁹³ The 'Samarāṅgaṇasūtradhāra', LIX. 193-197, describes the temple called Guhādhāra; its name however is derived from the division of the door-frame (dvārabheda) into several compartments (guhā) as it is also described elsewhere.

It should resemble the temple Simha. This possibly includes a half forgotten identification of the temple type called Simhāsya ('Matsyapurāṇa', CCLXIX. 28) and the Guharāja of the 'Br̥hat Saṃhitā' (see Part VII, second chart). "Viśvakarman has described 3000 types of temples" says the 'Bhaviṣya Purāṇa' CXXX. 36.

⁹⁴ ASIAR, 1915-16, Pt. II, p. 17. It is situated between Deogarh and Candpur in central India. This temple, of about the 9th century, similar in this respect to the Pārvaṭi temple at Nachna Kuthara has on the flat roof of its Garbhagrha, another though smaller cubical sanctuary—and on top of this a curvilinear Śikhara. In principle, the two temples types, the one with several storeys and the other with a curvilinear Śikhara are placed here one above the other.

⁹⁵ The Ānanda Pagoda in Pagan, Burma, being a 'Ku' or cave has such Kuharas, 'caves' or halls, in the 4 directions, radiating from a massive centre. The Burmese name for structural brick temples is 'Ku'; cf. note 104.

⁹⁶ 'Vāyu Purāṇa', Ch. XXXIX. 55-57 (śāla-grha; guhā-grha).

⁹⁷ Ib., śl. 1. This does not mean, as P. K. Acharya, 'Indian Architecture', p. 21, opines that "the 'Vāyu Purāṇa' maintains its unique position by dealing with the construction of various temples built on mountain tops".

⁹⁸ Ib., śl. 57; the large residence (bhavanam) of Kuvera and also 'Harṃya-prāsādas' are described on mount Piśācaka.

the gods have to be added, as places of worship, retreat and congregation, other natural caves and also those cut into the rock for similar purposes. The Ajivikas, a Jain sect, and the Buddhists were the first to do so; they were non-orthodox. Within Brāhmanism, the substitution of excavated caves for natural ones took time to evolve. There, as elsewhere, the sacredness of the particular site was to begin with, sufficient in itself; the Tirtha, in this case was specially marked by its being a cave. The heterodox sects preceded the Hindus by many centuries in their interference with, and transformation of nature. They had already achieved magnificent results in such large, apsidal vaulted 'churches' as the cave temple at Karli and in rock cut monasteries like those at Nasik or Ajanṭā (Nos. 8, 12, 13), when about 400 A.D. Brāhmanical worship cut its entry into the rock. It has the shape of a small, flat roofed Garbhagrha. To it is added, as in the contemporary Gupta temples, a structural porch or maṇḍapam (Udayagiri, Bhopal, C. I.).⁹⁹

No apsidal temple was cut into the rock for Viṣṇu, Śiva or any Brāhmanical form of divinity¹⁰⁰. The rock cut Hindu Garbhagrha is an equivalent of the structural flat roofed stone temple¹⁰¹; yet it is also preceded by the small, single rock cut cell and also by those which surround in numbers Buddhist monastic halls.¹⁰² It is however significant that a relatively large cell, at the centre of the far end of the hall and serving as the main sanctuary, appears in the Buddhistic excavations¹⁰³ only at an age when the flat roofed Garbhagrha had been set up in stone Prāsādas and cut into the rock.

In the temple at Udayagiri, for the first time the walled in stone quadrangle as it were entered the mountain; one stone-form, that of the dolmen, was put back

⁹⁹ This earliest Brāhmanical rock-cut temple is amongst the earliest fully preserved Brāhmanical shrines. It dates from the reign of Candragupta II, 382-401 A.D. (Cunningham, ASR, Vol. X, p. 41). The dated Ajivika caves in the Barabar Hills, Bihar, were excavated in the reign of Aśoka, in the 3rd century B.C.

¹⁰⁰ The apsidal plan was however adjusted to the use of Brāhmanical worship in structural temples, such as the Kapoteśvara temple at Chezarla, the Durga temple at Aihole, etc., and according to the 'Samarāṅgaṇasūtradhāra' (Ch. XLIX) must have been widely used. Cf. also SS. XLIX. 103-4; LII. 17, the Hastijātiya" type based on the square plan.

¹⁰¹ In the Lad Khan, Kont-gudi and 2 other small temples at Aihole, the Garbhagrha on the other hand is built against the back wall of the pillared hall (ASIAR, 1907, p. 201 f.); this position would correspond to a Garbhagrha cut deep into the rock and preceded by its maṇḍapa.

¹⁰² Garbha, Pāli 'gabbha', is also the name of rock-cut cells of the Buddhist monks connected with their large monastic halls. Such an establishment is called a 'navagabha Maṇḍapa' (Karli cave inscr., 'Ep. Ind.', XI, p. 119), if there are nine 'gabha' or cells; or also 'paca-gabha maṇḍapa' and 'sattagabha maṇḍapa', when their number is only 5 or 7 (Junnar cave inscriptions, pp. 131, 136). Any small room is finally called 'gabbha', in Pāli texts and denotes various kinds of chambers or rooms ('Cullavagga', VI. 3. 3.) which may be square or rectangular, etc. The use of terms such as 'pāsāda', or its equivalent 'vimāna'; gabbha, and also 'guhā', cave ('Cullavagga', VI. 1. 2) in civic architecture is also current in the Epics.

Dhātugarbha (dagaba) is the stūpa as receptacle or womb of the relics (dhātu) of the Buddha.

The Buddhist rock-cut cells again had their equivalent in structural cells; these in stone buildings, such as are preserved in Gandhāra were also used as shrines for a Buddhist image or a stūpa (Takht-i-Bahai). In this particular instance however they are not square, but rectangular, etc., and they have not flat roofs.

¹⁰³ In Vihāra No. 5 for instance in Ajanṭā, or No. 3 at Aurangabad.

into the primeval stone, the living rock. There the Garbhagrha retained its flat roof by adapting a natural ledge of rock.

In the quest for secrecy, the enclosure of the shed in Vedic rites, or also of the dolmen for purposes of the Hindu temple, was one way of attaining it. Another way less widely and only comparatively later resorted to in architectural form by the Hindus, led to cutting into the interior of the mountain, the living rock. The final solution is the Garbhagrha within the Prāsāda with its superstructure like a mountain.

The type of temple called Guharāja, has the shape of a cave (guhā) according to Utpala (Comm., Br. S. LV. 25). Its height, 32 cubits, follows the general rule, of being twice the width of the Prāsāda, and implies a superstructure as high as the walls of the Garbhagrha (Part VII. First chart). This King of caves, Guharāja, whatever its actual shape was, shares part of its name with Burmese brick built temples. In Burma, brick built temples with inner spaces are simply called 'Ku' or cave.¹⁰⁴ One of the temples at Pagan bears the name Shwe Ku, Golden cave. The Burmese Glass Palace chronicle tells about the erection of the Ānanda temple of Pagan, how King Kyanzittha requested eight Arhats to produce by their concentrated thought an image of the cave Nandamūla in the Gandhamādāna mountain. This they did and the King built a large Ku=Guhā, a 'cave', or temple in the likeness of the cave Nandamūla and called it Nanda.¹⁰⁵ The name of the cave, which properly is the Garbhagrha, appears here as that of the whole Prāsāda.

Cave and Mountain, in the architecture of Greater India are names for the total temple, Ku (Guhā) in Burma, Giri (mountain) in Cambodia and Meru, in Bali.¹⁰⁶ In India itself, and originally, they denote the interior respectively¹⁰⁷ and the high exterior shape of the Prāsāda. The interior with its cave darkness corresponds, to the deity known 'ab intra'. The exterior with its mountain slopes along the superstructure and the perpendicular walls of the Prāsāda displays to the light of day, the seed which has taken root, and sprouted.

Yet another secret place which also became integrated into the temple, is the place of the Omphalos, in the womb of the earth and below its surface. The cave, under-ground, the crypt,¹⁰⁸ is the main Garbhagrha of several preserved temples.

¹⁰⁴ R. Heine-Geldern, 'Weltbild und Bauform in Südostasien', 'Wiener Beiträge zur Kunst und Kultur Asiens', Vol. IV, p. 63. The central space in the Ānanda temple, Pagan, is a brick mass; the 'caves' are in the four directions.

¹⁰⁵ *Ib.*, p. 15. The Gandhamādāna mountain, acc. to the 'Viṣṇupurāṇa' II. Ch. II, 17, lies to the south of Meru. Cf. note 78.

¹⁰⁶ L. Finot, 'Sur quelques traditions Indo-Chinoises', 'Bull. de la Commission Archéologique de L'Indochine', 1911, p. 20; J. C. Von Eerde, 'Hindu-Javaansche en Balische Eerdiens', 'Tijdschrift voor Indische Taal, Land en Volkenkunde', LXV. 15-16.

¹⁰⁷ The 'water in the cave' is in the Garbhagrha the water with which Liṅga or image are laved in the daily rites. It passes from the image to a drain (prāṇāla) on the floor which traverses the middle of the north wall of the Garbhagrha, and leaves through a spout carved in the likeness of a Makara, etc. The water in which the Liṅga or image has been bathed is sanctified and therefore is made to flow to the north. The Ganges too, is most sacred where its course turns northwards. The northern direction implies an upward course, back towards the origin—high up in the mountains and higher still, in the celestial region.

¹⁰⁸ Guhā (cave) and 'gupta', secret, both from the same root, appear also as verbal equivalents of the 'crypt'.

Tamas, darkness, is the descending tendency, it is the quality proper of the underground crypt. Above it, the Prāsāda arises, ascends in height according to the Sattva-guṇa, and expands its perimeter as far as Rajas, requires it.¹⁰⁹ Tamas, darkness, is the causal body, the 'kāraṇa rūpa'. As it was in the beginning when out of primordial darkness evolved all things that be, so also from the deep, central darkness of the Garbhagrha the meaning of the temple shines forth on its walls and reaches the high point of the finial. Thus in certain temples there are two Garbhagrhas; above the crypt-Garbhagrha is the upper sanctuary, accessible or visible to all. The secret chamber of the Sūrya temple at Modhera, Gujerat, built in 1026-1027 A.D., is sunk to eleven and a half feet below the level, and is underneath the floor of the Garbhagrha of the temple.¹¹⁰ At Aundh, the principal Liṅga is in the crypt below; in the upper Garbhagrha is another Liṅga; steps lead down into the crypt from an opening in the floor of the upper shrine.¹¹¹ The present-day temple of Somanātha, Pattan, Kathiawar, also has a lower shrine. It surrounds the Somanātha Liṅga, symbol of the self-existent Omphalos. A 'duplicate' for every day worship is in the upper shrine.¹¹² In the Jambukeśvara temple, near Trichinopoly, in South India, the Garbhagrha below the level of the ground enshrines a Svayambhū Liṅga standing in water. The great sanctity of the non-man-made Liṅga, the hidden darkness of the not only innermost, but also of the lowermost, Garbhagrha, are proper to the Guhā, the secret chamber, around the omphalos, the navel and centre of the Earth and of Being; of this the Ādhāraśilā is one symbol and its place is the same.¹¹³ Above it is the Garbhagrha for the daily rites, and above these graded levels of secrecy and sanctity is the superstructure. The finial above it shines golden, high up, straight above the omphalos, or centre of the Garbhagrha, the womb and cave in the mountain. Or else no floor separates the lower and the upper chamber, they are one; only the sunk level is preserved. The one and only Garbhagrha is often much lower in level than the hall, the Maṇḍapam by which it is approached; stairs lead down to it, to a depth of seven or eight feet, or less;¹¹⁴

¹⁰⁹ The three Guṇas, Sattva, Rajas and Tamas, active in every form of manifestation, have in the form of the temple a comprehensive visual symbol.

¹¹⁰ J. Burgess—H. Cousens, 'Architectural Antiquities of N. Gujerat', ASWI, Vol. IX, p. 73.

¹¹¹ *ib.*, p. 75. About the temple at Aundha, Hyderabad, Deccan, where the floor of the Garbhagrha is considerably sunk below that of the maṇḍapam and the Liṅga is not seen from the "hall doorway", see H. Cousens, 'Mediaeval Temples of the Dakhan', ASI. IS. Vol. XLVIII, p. 78.

¹¹² Cousens, 'Somanātha', etc. ASI. IS. XLV. p. 28.

¹¹³ The underground situation of the place of greatest sanctity has been explained as a protective measure from the Mohammedans, as all the temples where it is so placed, were built when the Muslims had entered India. Apart from the fact, that the vast majority of preserved Hindu temples dates from these centuries, (10th to 12th), the presence of the Svayambhū Liṅga, the natural Omphalos, disproves the assumption.

¹¹⁴ In the temple of Amaranātha (Ambarnath), Thana District, Bombay, 1060 A.D., the floor of the shrine is sunk below the outside ground level and about 7' or 8' lower than that of the hall. Stairs descend to it. The possibility of an original shrine on the same level as that of the hall (Cousens, *op. cit.*, p. 13) does not detract from the fact of the sunk level, as it now is, of the Garbhagrha. Other temples in the Deccan, in Gujerat, Rajputana, the Central Provinces and Orissa are sufficiently widely distributed to be valid examples of a practised form of worship and architecture. In the Deccan, the Nāgeśvara temple at Karjah (Ahmednagar; *l.c.*, p. 58) has a shrine of which the floor is 6' below the floor of the hall approached by a flight

the actual extent into depth finally is immaterial as long as the descent is marked by the level of the floor being lower than that of the threshold, be it even by one step only. In Orissa, the name for the Garbhagṛha is Gambhīrā, the deep lying.

The different levels below ground and above producing two sanctuaries are destined for various rites; they are not restricted to a definite position. The dividing line may be the ground surface; it need not however be only there but is applied in the vertical direction so that one sanctuary is above the other. Made independent of a definite level, the principle is that of vertically superposed sanctuaries. This is known from Gupta and Early Cālukyan temples, in northern India, the Deccan and in South India. It is as if the sanctuary from below the ground with its omphalos in the shape of Liṅga or image had arisen to the higher levels. Sanctuary upon sanctuary, they are superposed in several storeys, particularly and consistent with the total symbolism of the respective temples, in South India. There, the special application of this principle is to those temples of Viṣṇu where in seven superposed storeys, the lowermost cell enshrines the standing (sthāna), the next higher one the seated (āsana), the one on the third floor the recumbent (śayana) image of Viṣṇu, as in the Vaikunṭha Perumal Temple at Kāñcīpuram, and in the yet higher storeys the images of Brahṁā, Mahāviṣṇu, Sadāviṣṇu and the four armed Nārāyaṇa. "Like a hollow cane of bamboo (veṇurandhravat) are the cells placed one above the other in the vertical axis of the Prāsāda" ('Vaikhānasāgama', VI).¹¹⁵

The ascent of the cave along the vertical axis of the Prāsāda is by a twofold process, which is one in nature; by coalescence, and reduplication or repetition, the crypt arises on to higher and higher levels. The vertical axis of the Prāsāda always passes through its centre.¹¹⁶ By its ascent from underground, the crypt

of steps leading down from inside the shrine doorway. The ante-chamber is 2' lower than the hall floor, a graded descent to the origin and centre, just as inversely, the superstructures with their finials, of several halls mark the graded ascent, level upon level, in many 'bhūmis' towards the final point on high (Pl. I). As above, so below, with the corresponding changes of direction, form and accessibility. The sunken shrine of the Śiva temple of Lonad (Kalyan) is three feet below that of the Maṇḍapa (ibid., p. 21).

The shrine of the Śiva temple at Rajur (Buldana) is still deeper than that of the temple of Amaranātha, and similar to it is the temple at Chandol (Burgess-Cousens, op. cit., p. 15). In Rajputana, in the temple at Visalpur, near Deoli, of the year 1174 A.D. the Garbhagṛha is three and a half feet lower than the Maṇḍapam (Cunningham, ASI. Report VI). The Jyotirliṅga temple of Oṅkāra at Mandhata (Narmada; Cousens, 'Mediaeval Temples of the Dakhan', p. 13) and the temple of Boram Deo (near Chapri, Chattisgarh; ASI. vol. XVIII. p. 34) show also by the difference of floor levels of Garbhagṛha and Maṇḍapa, the secret (gupta) nature of their crypt and sanctuary, the Garbhagṛha.

In many of the temples in Bhuvanesvar, Orissa, dating from the ninth to the twelfth century (Mārkaṇḍeyeśvar; Bhāskareśvar, Pāpanāsinī, etc.) the floor of the Garbhagṛha is several feet below that of the 'Jagamohan' or Maṇḍapam.

The so-called "Bhāskareśvar" temple (M. M. Ganguly, l.c.) is called Megheśvar by the local people and *vice versa*. The above remark refers to either of these shrines.

¹¹⁵ Cf. the construction of the Liṅgarāja Prāsāda, Bhuvaneśvar, and others, note 49.

¹¹⁶ The plinth or also the terrace on which the temple stands do not necessarily take part in this vertical extension. Some of the highest Prāsādas, especially in Orissa, as those of the Liṅgarāja Temple, Bhuvaneśvar, (middle 11th century), have no socle. The Prāsāda rises straight from the ground, although lesser temples, but not the very least ones rise from a plinth (M. M. Ganguly, 'Orissa and her Remains', p. 107).

comes to take the place of the cave in the mountain, which is the image of the complete Prāsāda with its superstructure.

In some shrines (Kandariya Temple, Khajuraho, Fig. i; Pt. VI) the Garbhagrha far from being lower is even higher in level, than the Maṇḍapam. It is raised into the height of the Śikhara, itself partaking in its ascent.

In the terrace temples (p. 149) a hollow central shaft below the high sanctuary is extended vertically across the terraces.¹¹⁷

The superposition of cavities, in the interior of the temple, took place along the vertical axis; below ground and above, on various levels. In principle, it inheres in the temple with its high superstructure. The buildings however, but for the type of the Vaikunṭha Perumal temple, do not show the vertical series of their internal cavities.

The underground crypt is secret; and in the vast majority of temples there is but one Garbhagrha, closed on top by a flat ceiling or shallow dome which seals, as it were, at the same time, the interior of the superstructure (Fig. i, Part VI).

The Garbhagrha, the Cave in the Mountain, lies below its highest point. Along this axis, on any level of the temple, there is, in principle, this secret centre. Even though it is inaccessible from within, its position is marked by the superimposition of surrounding storeys (bhūmi) on the monumental body of the Prāsāda (Fig. h, Part VI).

The sum of all the possible cavities, one above the other, in the centre of the temple, is "like a hollow reed". It traverses, in principle, though not structurally, the temple from the apex to its foundation. On top of the superstructure, the "hollow reed" or shaft is seen to emerge from the body of the temple. It exceeds it by a short span and is crowned by a 'dome' (Figs. f-h, Part VI) or by the Āmalaka (Fig. i; and Pl. I) of the temple.

The socle (pīṭha) where present, is a solid substructure, the upper surface of which forms the floor of the building. The crypt may be within the socle or base or extend below the outside ground level. The Pīṭha, where present, is piled on top of the completely filled in, solidly, or by cells, originally excavated site of the entire building. This is the general practice and the texts corroborate it.

¹¹⁷ This and all other information about Ahicchatra has been received by the courtesy of Dr. R. E. Mortimer Wheeler, Director General of Archaeology in India, through Mr. A. Ghosh, Superintendent of Archaeology, Excavations Branch, who writes: "Of the two most prominent temples at Ahicchatra, one was more or less completely explored, while the other and bigger one had to be abandoned before it could be fully understood. There are some other temples.

Both the temples underwent several repairs and restorations, resulting in horizontal and vertical increases in their dimensions. In all their stages, however, they are square in plan with projections on the west for flights of steps.

The fully exposed temple has three storeys in its last three stages. The first and earliest stage being buried very deep below the later superstructures was imperfectly explored.

The plan of each single storey is square. There is no shrine on each storey, the only one being on the top. Each terrace leaves a sufficient space between the central part and the parapet for serving as ambulatory.

The axis of the temples consists of a hollow central shaft, filled with debris, on the top of which the sanctuary was erected. In neither case has the central shaft been exposed to the lowest depth. In one case it was dug down to 12 feet from the top.

The earliest stage of the temples evidently belongs to the Gupta period, as one of them was founded on a level yielding typical pottery of the Kuṣāṇa period. . . . They continued in their last stages till the end of the tenth or eleventh century".

(C) THE FORM OF THE VERTICAL AXIS

The Prāsāda is the place and symbol, by means of architecture, of manifestation and reintegration. For this purpose it is built. All the images together with all the forms that may serve them are incorporated in its structure.

India not only thinks in images. It builds them up in a consistent body of which the sum total is the temple. It takes them from the store house of memory; similar forms once used in sacred rites meet, fuse, are absorbed the one in the other and contribute their particular meaning to the new context. The small space of the Garbhagrha is extracted from various confines and placed within the walls of the Prāsāda. The dolmen, from the aboriginal side, has been incorporated into the Prāsāda and raised on a socle (adhiṣṭhāna) so that it is ensconced within its mountainous shape, and similarly, from the Vedic tradition, the sacrificial shed¹¹⁸, as an enclosed ritual place, shares in its closeness as much as the images of the cave in the mountain, of the heart and the womb.

The vertical axis of the Prāsāda leads from the Highest Point, the summit of its finial, above its body, to the centre of the Garbhagrha. It is not visible from outside, except where it emerges from the body of the superstructure, having the appearance of a horizontal section of a pillar, round, as a rule (Pls. I; LXXI.) but also polygonal (Fig. f; Part VI). This pillar is also not visible from inside the Garbhagrha which, as a rule, has a flat ceiling. Nonetheless it inheres in the Prāsāda: however solid a monument its superstructure is, it traverses it like a hollow reed. On whatever level the Garbhagrha is situated this hollow reed passes through its centre. The pillar inheres in the Prāsāda, which is the universe in a likeness. The Pillar of the Universe, the Axis Mundi, inheres in the World Mountain. All its strata are placed along its axis and their totality is the sheath of the Pillar. It has the shape of the Prāsāda.¹¹⁹

The pillar within the Temple corresponds to the vertical channel marked by the Svayamātrṇṇā stones of the Fire Altar. In it move the immanent breaths of earth, air and heaven (Ś.B. VIII. 7. 3. 13; 19; 7. 4. 1), to the heaven-light (VIII. 7. 4. 6). The Agni finally is bestrewn with chips of gold (VIII. 7. 4. 7-9); the finial too, shines golden above the multiform body and raiment of the temple.

The World Pillar inheres in the World Mountain and transcends it where it becomes visible above the highest stratum of the superstructure. The mountain shape of the Prāsāda is the sheath of its vertical axis. The vertical axis is clothed in it, from the floor of the Garbhagrha to the shoulder course of the superstructure; from there however it is seen to exceed the body of the superstructure (Śikhara, in Nāgara temples; the series of Bhūmis in Drāviḍa temples). Encased in the

¹¹⁸ The rectangular wooden temples of Malabar and their stone replicas (Bhatkal) are relatively nearest in type to the "shed".

¹¹⁹ *Veṇukośa* or 'sheath of the reed' is one of the synonyms designating the superstructure. Cf. The 'mantle' (*kañcukā*) of the Stūpa (cf. Coomaraswamy, 'The two reliefs from Bharhut in the Freer gallery', JISOA, vol. VI. pp. 149-62).

vertical shape of a pillar, which is circular, as a rule, or polygonal (Parts VI and VII), it transcends the slopes of the superstructure although for a short distance only. It is therefore called Grīvā or Neck.¹²⁰ It emerges from the body of the Prāsāda to be capped by a dome (Figs. f-h; Part VI) or clasped by an Āmalaka (Pls. I, XLIII, LXXI). These crowning shapes of the Pillar support the finial of the temple. Its Highest Point, the end or beginning of the axis of the temple, is in the centre of the hollow shaft above the Līṅga or image in the Garbhagrha, above the Womb and Centre of the Cosmos and above the Navel of the Earth.

The finial is beyond the body of the temple, which has its extension in Antarikṣa, the mid-space. Above its High Temple (harmya) and cupola (śikhara); (Figs. g-h, Pt. VI),¹²¹ above its being gathered by the Āmalaka¹²² (Fig. i) rises the finial, the Stūpikā, in the Empyrean and up to the Bindu, its Highest Point, the limit between the unmanifest and the manifest.

¹²⁰ The proportionate height of the Neck (grīvā) is given in Part VII; it varies in the different types of the temple. The Grīvā of a South Indian Prāsāda connotes the walls of its High Temple (Vimāna; Harmya).

¹²¹ In the South Indian tradition Śikhara connotes the dome shape crowning the shaft of the Pillar. Śikhara in the North Indian tradition however is the curvilinear superstructure of the Garbhagrha.

¹²² Āmalaka is derived from 'mal', which means "to gather", see Part VIII.

VI

THE SUPERSTRUCTURE

शिखरस्य तु भेदेन सर्वेषां भेदमुद्दिशेत् ।

“One should point out the differences of all (the Vimānas) from the differences of the Śikharas.”

‘Īśānaśivagurudevapaddhati’, III.
Chapter XXVIII. 42.

VI

THE SUPERSTRUCTURE

I. THE PYRAMIDAL SUPERSTRUCTURE

"On an enclosed space they hold the laud in order that they may encompass the Brahman" ('Pañcaviṃśa Brāhmaṇa', IV. 9. 11). To encompass the Brahman, to build up in space a compartment corresponding to the Brahmasthāna on the plan, the Vāstupuruṣamaṇḍala, the dolmen lent its stone walls; they were raised on a socle. A flat roof which served also as ceiling shielded the enclosure on top. The all filling presence of the Brahman, as Brahmā or manifest divinity, was marked by a Liṅga or was centred in an image of the respective divinity. The temple was thus complete in the shape which it has in Unchahara, or in the Gupta shrines of Central India. Enclosure, concentration in secrecy, and their elevation on a level above ground are thus attained and given form; but not as yet has the purpose of this concentration in secrecy been given its architectural form or outward effect. The image within the cavity had itself been raised on a socle, its altar, upon the base of the temple. In this repeated raising of the object of concentration on a higher level, an impetus finds expression in the vertical direction; concentration on the divinity and the elation that accompanies it bring about the elevation, the deity is extolled on ever higher levels until its worship reaches the highest point, the zenithal pole of realisation where this world ends and that world begins, the point limit of the manifest and unmanifest, the Bindu.

Works of architecture serve a purpose; the Hindu Temple as much as a Gothic cathedral exceed their function of being a house or seat of divinity. While their orientation and expansion are in the four regions of space, their main direction, in the vertical, is towards God, the Supreme Principle, which is beyond form and above His seat or house of manifestation. From all the regions of space, from its walls in the four directions and their corners in the intermediate directions, the Prāsāda rises bodily towards its high point, tier on tier, until diminished in its bulk it forms the High Altar (vedi) on which is placed the crowning High Temple or the Āmalaka with its finial that ends in a point.

Metaphysical knowledge and realisation by religion have their visible residue in architectural form, in its fundamental shapes and their relation. The square and cube of the walls of the Garbhagrha, seen from outside, encompass the Centre; thence they rise to the Highest Point by way of the pyramid or such similar shapes which effect a transition from the square of extensiveness, the Vāstu, and from its enclosing walls to the point. The pyramid or its curvilinear equivalent, the

Śikhara, placed on the cube, are the inevitable form of the superstructure of the Vimāna.

The pyramid or its curvilinear equivalent is the superstructure on the walls of the Garbhagrha (Figs. h, d; Pls. I, XLIII, LXXI), the means by which the purpose of the temple is shown to those who come to see it (darśana) and to attain release. Inside the Garbhagrha, in the interior of the temple, the superstructure has no effect but that of darkness if it is hollow; a ceiling, however, as a rule, occupies the position of a flat roof.

The Līṅga or image in the Garbhagrha, the main object of worship, is the place sought after by the devotee, the Centre where he is made whole. To this centre also leads the vertical, from the high point to which his eye and mind while he approached the temple had been led by the superstructure. The interior cavity, the Garbhagrha, is the place of release; the external form of the Prāsāda is its monument. Extended in space, its body is reduced to a central point even beyond its bulk.¹

The Prāsāda is piled up with the logic inherent in fundamental form; cube and pyramid for example yield the meaning of their co-ordinated shape along the vertical axis. In terms of volume their combination is the result of expansion and then of concentration and contraction; the total monument, the Prāsāda, is a symbol of manifestation on its vertical walls and together with them of its gradual reduction to the point above the sloping sides of the superstructure.

Such one-pointed monumental forms are not seen in the representation of sanctuaries preserved in early Indian art, in the Buddhist reliefs carved from about the second century B. C. to the third century A. D. To the Buddhists, it seems, Prāsāda meant palace and temple as well, whereas a Hindu temple, the Prāsāda proper with its superstructure leading to the Highest Point, cannot be mistaken for, or derived from a palace or any dwelling of man.

The term Śikhara was established in Vāstu-śāstra, the texts on architecture, which are known to us from the sixth century A. D. onward only. There it refers to the superstructure of the Garbhagrha; in the fully evolved Hindu temple north of the river Kistna it is the most conspicuous, indispensable part of the exterior of the Prāsāda. The Śikhara is here understood as the mountain or peak like super-structure above the perpendicular walls of the Prāsāda. It is curvilinear, as a rule.

In its most widely accepted types, the superstructure comprises the parts which are either a curvilinear and truncated body, a neck (kaṇṭha, gala, grīvā) and crowning part (āmalaka, Pls. I, XLIII, LXXI) or a pyramidal truncated body and on it a small High Temple (vimāna; harmya) whose 'walls' form the neck (kaṇṭha, gala, grīvā) of its massive dome-shape as the crowning part (Figs. f-h). Śikhara in the present context is used to denote the whole super-structure including the 'crown' and up to the finial; this is the generally accepted meaning in early Vāstuśāstra.

In South Indian texts, however, the pyramidal superstructure is designated by the number of its storeys (bhūmi) whereas Śikhara is the name of the dome-shaped massive roof of the small crowning miniature temple only (vimāna = kṣudra-

¹ The entire Prāsāda is a superstructure on the Vāstupuruṣamaṇḍala.

THE SUPERSTRUCTURE

alpa-vimāna; see Pt. VII). Śikhara in this sense is the subject of verses 65-74, ch. XXXII of the 'Īśānaśivagurudevapaddhati', Part IV. This Śikhara or massive dome-shaped roof is described as square or circular, six or eight sided.

I A

Fig. a.* Līṅga shrine, Mahākūṭeśvar; Type IA.1.

Fig. c.** from Sārṇāth; Type IA.2.

Fig. b.* Temple No. 10, Aihole; combined Type IA.1 and IB.1.

* Drawn after H. Cousens, 'The Chālukyan Architecture', ASI, vol. XLII. NIS, Pls. XXVI and XIX.

Similar shrines (Fig. b) at Mahākūṭa have a crowning Āmalaka but are without corner Āmalakas (ASI, Bombay Photographs, 1939-40, Nos. 9554, 9555, 9558) and at Kurnool (Satvel, Rāmalingeśvarasvāmī Temple; 'South Indian Epigraphy', 1940-41, Photograph No. 1973).

** Drawn after a relief of the Gupta age; Coomaraswamy, 'Early Indian Architecture', 'Eastern Art', III. Fig. 59.

Sikhara thus particularly denotes a shape curvilinear in the vertical section whether it is used to designate the whole superstructure of Northern Indian Prāsādas or the cupola of the High Temple only which is placed on top of the superstructure of South Indian Prāsādas. This twofold use of the term Sikhara in Indian Vāstuśāstra has led to wrong interpretations. Its square or round, etc., horizontal section on South Indian temples (śiraś-chanda; 'Mayamata', XVIII. 1) has mistakenly been considered by modern scholars a criterion of the entire superstructure of a Hindu temple.

Sikhara, however, is an ancient term of Indian architecture; it is used frequently both in the 'Rāmāyaṇa' and in the 'Mahābhārata' when alluding to the Prāsāda in the shape of a mountain, like Kailāsa or Meru. With its storeys it is itself like a mountain ('Rāmāyaṇa', IV. 33. 8)² whatever its actual form might have been, of which there is no clear indication given in the Epics. The Prāsāda, high and dazzling like Mount Kailāsa in the Himālayas and like Mount Meru which is known only by the mind, is the seat of divinity and the World Mountain, symbol of the polar axis, the vertical which leads from the Centre to the Highest Point. While the whole temple is generally likened to the Mountain, the term Sikhara in early Vāstuśāstra generally applies to every variation of the superstructure which rises from the perpendicular walls of the Prāsāda, and covers the Garbhagṛha.

Its pointed form is generally accepted and preserved in India from the fifth or sixth century A. D. to this day. Various kinds, however, of high roofs of the Prāsāda exist; the apsidal temple with a barrel roof,³ or a rectangular sanctuary with its superstructure crowned by a vaulted roof having a ridge;⁴ neither of

² Some of the many later inscriptions which so describe it are given here. "Om, a Prāsāda above Himavan . . .", Inscription of Meruvarman, ASIAR, 1902-3, p. 243. Elsewhere, a stone temple is dedicated "resembling in lustre the mountain Mandara" (ASIAR, 1905-6, p. 183).

The Khajuraho Inscr. of the Vikrama year 1011 (A.D. 953-54) discovered amongst ruins at the base of the Lakṣmaṇa temple, verse 42, extols "a charming, splendid home of Viṣṇu which rivals the peaks of the mountains of snow". 'Ep. Ind.' vol. I. p. 121 f.

In South Indian Vāstuśāstra the entire superstructure is discussed according to its number of 'storeys' (bhūmi) ; it bears no special name.

The passage of the I. P. given above, strictly refers to the shape of the massive dome of the small High Temple on top of the storeyed pyramid of a South Indian temple. The other parts of the temple should be the same "yathārhaṁ tu yathāśobham" lit. as is fit and beautiful (IP. III. XXVIII, 42).

³ This type appears to be an adaptation of the Buddhist Caitya hall. The Kapoteśvara temple at Chezārla appears to have been such a Caitya hall converted for Śaiva worship.

The Vadamallīśvara Temple at Oragadam, near Mamallapuram, of the 10th century (ASIAR Southern Circle, 1914-15.) has an apsidal superstructure above its Garbhagṛha, from which it is closed off by a ceiling of teak wood rafters, concrete and plaster.—The Hastipṛṣṭha type figures in Vāstuśāstra, from the temple called Kuñjara, in the list of the "20 temples" of the 'Bṛhat Saṁhitā'.

⁴ Bhīma Ratha at Mamallapuram, about 650 A.D. ; the Navadevī shrine at Yageśvar, Almora (8th-9th century ; ASIAR, 1928-29, Pl. IV) ; the Vaital Deul or Kapālinī Temple, Bhuvaneśvar, Orissa, about 850 A.D. ; the Teli-ka-Mandir, Gwalior, 11th century ; the Vaital Deul represents a subvariety of the Khākharā type, also the Teli-ka-Mandir. The 'Bhuvanapradīpa', ch. XCVII, (ed. N. K. Bose, pp. 171-73), distinguishes three varieties of the Khākharā type ; Draviṛā, Baṛabhī and Kosoli ; these names appear to refer to an originally geographical distribution

these vaulted shapes with their horizontal sky-line express the ultimate aim of Hindu life, which is Mokṣa, release by reintegration. These types, reminiscent of buildings as represented in Buddhist reliefs and also in some of the early paintings in Ajanṭā, were not destined to be generally accepted forms of the superstructure of the Hindu temple. The keel vaulted shape became the typical top of the gate towers, the Gopuras, of temples in South India.

Apart from these vaulted roofs there are several types of domes represented in the reliefs mentioned. They belong to the huts of hermits, to chapels or to temples. The Nāga or Fire chapel represented in one of the Sāñcī reliefs is supported on four posts and has a dome which shows a construction in sections. In this and other examples, four or eight spherical triangles are joined with sharp edges. It is seen in other reliefs that round domes were frequent over circular buildings.⁶ These various dome-shapes were transmuted, as extant examples show, from their leaf covered prototypes (*parṇakūṭa*, *parṇasālā*) and bamboo frame, into brick and stone; they form the solid dome-shape of the small High Temple which crowns the South Indian Prāsāda with its pyramidal superstructure.

The pyramidal trunk itself of the superstructure has no prototype in the relief representations of Barhut and Sāñcī. Only the dome of the High Temple, the small Vimāna (Figs. e-h) resembles by its external shape the types of domed buildings represented in the early reliefs. The High Temple however is not a building, it is a massive crown of the monument.⁷ As a rule the storeyed pyramidal super-

Fig. d.⁵ Temple No. 9, Aihole

of the varieties of the Khākharā type, but similar to the names of the domes of Śikhara in South Indian temples they are used for the purpose of classification only. Cf. Pt. VII, note 56.

⁵ From Cousens, 'The Chālukyan Architecture', Pl. XVI.

⁶ Agni-gr̥ha ; -agāra ; -sālā ; -śaraṇa denote a Fire chapel ('Rāmāyaṇa', II. 91, 11 ; 99. 12, etc.). Huts with domes in four sections are represented in Barhut (R. P. Chanda, 'Beginning of the Śikhara of the Nāgara Temples', Rūpam, 1924, Figs. 1-3) ; a circular temple with a round dome, the Sudhamma Devasabhā also in Barhut (ib. fig. 4) ; cf. Pt. V, note 18.

A building, having apparently an oval—or rectangular—plan and an oval (?) curvilinear tiled roof with a ridge, is represented in a relief of Stūpa II; Sāñcī ; Marshall-Foucher, 'The Monuments of Sanchi', vol. III. Pl. XC, 86a.

The Nāga chapel is represented in the second panel on the interior face of the left jamb of the East Gate.

⁷ The non-structural function of the diminutive High Temple is also to be seen on one

structure is nothing but a monument; it may be altogether solid, such internal space as it then may contain lessens its weight, is due to structural expediency and being unassessable from outside and, as a rule, inaccessible, has no architectural significance.⁸ This applies also to the curvilinear Śikhara.

The superstructure of the Hindu Temple is not a high roof. None of the roof forms represented in the early reliefs nor built to-day in rural India have been stretched or stilted in order to yield the height of the superstructure.

The superstructure of the Hindu temple is a monument whose *raison d'être* is symbolical. Where it is piled up in horizontal tiers, each similar to the other, their profiles owe their variety in different types of temples to several architectural constituents which in their original context have their main extension in the horizontal. The horizontal courses and mouldings of the superstructure are adaptations of various structural forms. The main tiers or storeys are called *Bhūmi*; they are the levels of the superstructure and of the spiritual ascent of the devotee.⁹

The two main types of the superstructure of the fully evolved Hindu temple both have truncated bodies; their sides which are either straight or curved are terminated by a platform (*skandha*; the shoulder course). Above rests the crowning portion, (a miniature *Vimāna* or an *Amalaka*) whence rises the finial.

The ascent towards the highest point, is given shape by a concourse of several components. The pyramidal superstructure, in its generally accepted shape in South India for example, (Figs. f-h), is composed of three main factors of which (1) the recessed tiers or storeys are the chief and supporting element; (2) above the last of these storeys rises the miniature *Vimāna* or *Harmya*, the High Temple; (3) each storey is surrounded by a rampart or enclosure composed of chapels. In this its complete form, the pyramidal superstructure is an amalgam of several independent types of buildings. Its form is complex; it is, however, not the only of its kind. Contemporary with it are other forms of the pyramidal superstructure, though less rich in components.

The evolution of the superstructure did not take place in one narrow channel. Contributors to its form are many and so are their combinations but their conjunction is to one end, to lead from a broad base to a high central point; all the resources that lend themselves to this end are strung together and amalgamated. Simple, aboriginal types for example are incorporated in the most evolved and complex monuments.

One of the sites most helpful in gaining an understanding of several leading types of the superstructure is *Mahākūṭeśvara* (*Makūṭeśvara*), near *Bādāmī*, *Bijapur*

of the small shrines of *Aihole* (No. 11); Cousens, 'The Chālukyan Architecture', p. 48, fig. 13; it is placed above the flat tiers of the pyramidal superstructure. The designation "High Temple" is made by analogy of the term "High Altar".

⁸ See however the *Vaikuṇṭha Perumal Temple*, in *Conjeevaram* (Pt. V, note 89); or the *Mahābodhi Temple* in *Bodhi-gayā*, which had a chamber opening from the second storey.

⁹ In some temples in *Bhuvaneśvar*, *Orissa*, constructed after the tenth century and generally in temples of Northern India subsequent to the thirteenth century, no horizontal mouldings appear on the curvilinear *Śikharas*.

The '*Bhuvanapradīpa*' (N. K. Bose, 'Canons of Orissan Architecture', p. 114) enumerates in the downward direction, the presiding divinities of a *Śikhara* of 10 *Bhūmis*.

THE SUPERSTRUCTURE

District, where many temples surround a tank in which a small Liṅga shrine is built (Fig. a). The main temple, that of Śiva Makuteśvara, has given its name to the place and is mentioned in an inscription dated 601 A. D. from which it appears

to have been constructed in the third quarter of the sixth century. In its superstructure are combined all the factors mentioned above by which is distinguished the most complex type of its Southern form. Other temples of this site have pyramidal superstructures of a more simple type; others again have curvilinear Śikharas, fully evolved as far as their constituent factors are concerned.¹⁰

The temples at Mahākūṭeśvara having curvilinear Śikharas¹¹ may also be of the same or a slightly later date; they seem to correspond to the types of temples which are classified in the 'Brhat Samhitā' of the sixth century and the 'Matsya Purāṇa' which have doubtlessly Śikharas of the curvilinear type.

The Pāpanātha temple at Paṭṭadakal was built after 650 A. D. Here the curvilinear Śikhara is closely related to those of Aihole (Fig. d) and Mahākūṭeśvar and appears to represent a more fully evolved type: the central buttress having its compositional theme perfected in a continuous pattern which forcibly sets it off against the lateral parts of the Śikhara. This is not so clearly evident on any of the other temples referred to and may indicate that they represent an earlier phase of the curvilinear Śikhara.

The importance of the site of Mahākūṭeśvar is supplemented by the early temples of Aihole, Bādāmī and Paṭṭadakal, all closely related historically, being the three successive capitals of the early Cālukya dynasty. In this small triangle of the Kanarese country from the fifth to the seventh century and later, the many shapes which were to remain the essential constituents of the superstructure of a Hindu temple to this day appear assembled and variously combined.

The following constitute the main contributions to the formation of the superstructure :

I. The principle of stratification in receding tiers. It has two main branches, the one (IA) having a flat or sloped roof, its cornice or eaves, for its unit, and the other (IB) having a complete storey for its unit.

II. The shape of the 'Tabernacle', the primeval sacred structure made of bended bamboos, branches, etc. It gives its curvilinear outline to the Śikhara. In its earliest appearance in preserved temples,¹² the horizontal courses of mouldings (IA), are embodied in its curved surfaces (Fig. d).

It is seen thus that type I in its form IA, is also merged in type II,¹³ whereas type IB exists by itself throughout South India.

In type IB, the following are the main contributors :

(1) the central 'cube' in reality a low prism, of the walls, repeated in each storey; (2) the High Temple or miniature Vimāna, the neck and crown of the pyramid; (3) the enclosure or rampart of small shrines or chapels surrounding the

¹⁰ The date corresponding to 601 A.D. is given in an inscription at Mahākūṭeśvara, H. Cousens, 'The Chālukyan Architecture', op. cit., p. 52. The temple of Mahākūṭeśvara with its rectilinear superstructure consisting of storeys is thereby definitely dated. See also note 57.

¹¹ Cousens, op. cit., Pl. XXVI.

Re. the Pāpanātha Temple, see ib., p. 68; Pl. L.

¹² See Part V, notes 75 and 67. Fergusson, HIEA, I. p. 324, rightly remarked: "The style is complete and settled in all its parts. There was no hesitation then, nor has there been any since."

¹³ See however note 9.

THE SUPERSTRUCTURE

central walls and in some of the earlier South Indian temples sufficiently distant to allow for an air space between the central walls and the rampart of chapels (Figs. f-g).

I B

Fig. h. Bhadīśvara Temple, Tanjore

Type II has an Āmalaka for the crown of its high trunk. It is a flattened shape, a cogged stone of which the circular horizontal sections are scalloped or lentil like, etc. The scallops are generally convex (Pls. I, II) and rarely concave (Pl. XLV). Every curvilinear Śikhara on a square or circular base has an Āmalaka as its crown.

The Āmalaka, however, crowns also type IA¹⁴ (Figs. a, c); its place furthermore, is also at the corners of a Bhūmi or 'storey' of type IB.1, and at each unit of several strata, of type II (Fig. d). Whereas a 'storey' or Bhūmi of the type IB roughly corresponds, on a reduced scale to a storey in the usual sense and consisting here of the wall with its pillars, architrave (IB.1), and, in South Indian temples, a roll cornice, the latter representing the edge of the roof, its eaves, a storey or Bhūmi in types IA and II consists of eaves and recesses alternating or combined in several courses.

The High Temple similarly is not confined to type I only. A certain variety of the curvilinear Śikhara (II) rising from the rectangle of the temple walls is crowned by a High Temple.¹⁵

Type IB and type II are the most widely represented forms of the superstructure. The curvilinear Śikhara (type II) is the general form of the superstructure—though not the only one—throughout Northern India as far south as the rivers Kistna and Tungabhadra. Further south, in the Drāviḍa country, it ceases altogether. The northernmost representative of type IB is the rock-cut Kailāsanātha temple in Elura.

Type IB prevails in the Drāviḍa country and is well represented in the Kanarese districts of the Deccan. In earlier centuries, from the 5th to the 8th approximately, type II also was frequent in the Kanarese districts (Fig. d) but subsequently its occurrence is rare.¹⁶ Certain of its features were combined with type I and a new style was then evolved.

Some of the main components are common to types IA and II. Type IB shares with them many lesser particulars (Śukanāsā, and others) besides the main principle of their combination. Type IA occurs sporadically in different parts of India. This is also true of type IB where its component IB.1 is found forming a sub-variety in which this type of superstructure consists of a superposition of wall prisms or sanctuaries only, in receding storeys.

The superstructure, type IB.1-3, however, is a composite monument in which have been coalesced various forms of buildings and their combinations.

The curvilinear Śikhara, type II, is the most prolific; it is built over the largest part of India and is also a nucleus for innumerable variations of which the theme is always the shape of the Tabernacle. Formed originally from the curves of vegetation, similar in their meeting at a point to the curves of a germinating plant, it throws forth part-forms of itself, parts of its own intrinsic shape, alike a living plant. Its expanding, proliferating exuberance is, however, gathered and united in the point towards which its curves ascend.

¹⁴ Liṅga pavilion at Mahākūṭeśvara, etc. Cf. also the temples at Sūtrapāda, etc. in Kathiawar.

¹⁵ This type has a rectangular and not a square plan (Pt. VI, note 4). It is known as Khākharā; N. K. Bose, op. cit., Pl. preceding p. 49. 'Īśānaśivagurudevapaddhati', III. ch. XXIX. 107 (kakara-koṣṭhaka).

¹⁶ The temple of Gaṇapati at Hangal, Dharwar; Cousens, op. cit. Pl. LXXXVII.

Precursors and contributors of type I, on the other hand, are found also in Northern India, in the Panjab, in Bengal, etc. (Pt. V, note 89).

THE SUPERSTRUCTURE

The single point towards which are raised its curved sides, is also the aim of type IB in which have congregated several forms of buildings and planning. They have been absorbed by the discipline of its pyramidal shape. The evolution of this type is not by proliferation but by increasing coalescence.

In the various parts of India, in the course of roughly one millennium, many solutions were found and in part rejected. The main components of the superstructure have been indicated; their places of origin in different traditions will now be traced. However wide apart these may lie, the superstructure, together with the *Prāsāda*, in its fully evolved form is one consistent monument. Seen from outside, the socle or base supports its perpendicular walls from which rises the superstructure and carries the crown of the temple, the High Temple or the *Āmalaka*, on which rests the finial. Superposition of several units and their coherence in one solid monument is once again the principle of the superstructure itself, in its composition along the vertical.

Structural forms of architecture such as the Tabernacle, the dome, and also the wall cube or prism of the 'dolmen temple', its cornice and other roof forms and their eaves are as much integrated in the monument of the superstructure as are also originally non-structural and purely symbolical forms of architecture of which the *Āmalaka* is the foremost. The conjoining of these constituent parts, in various selections and their consolidation in well defined types have produced the multiform countenance of the superstructure.

IA: THE PYRAMIDAL SUPERSTRUCTURE FORMED OF SLABS

IA. 1: THE STEPPED TRUNK OF THE PYRAMID

The superstructure is seen to enter the history of Indian architecture in one of its pristine modes in the water-pavilion at Mahākūṭeśvar (Fig. a). On a flat roof slab, supported by 4 corner-pillars only, another smaller slab is placed and above it in the centre is an *Āmalaka*. The slabs which thus cover the Liṅga pavilion in the tank called Viṣṇu-puṣkariṇī of Mahākūṭeśvar form the initial steps of the pyramid. With them is associated the *Āmalaka*. The *Āmalaka* here has the same appearance which distinguishes it as part of the capitals of rock-cut pillars in Western India of the 1st and 2nd centuries A.D. and as part of the shaft of Buddha-pillars carved in reliefs in Amarāvati in South India.¹⁷ Where however it is part of the shaft of the pillar the latter appears to pass through it and to be clasped by its cogged rim.¹⁸ It is then a ring-stone, perforated. On the pointed superstructures of the temples of India north of the Kistna, the *Āmalaka* is the support of the finial of the temple and is itself supported by the round shaft of the

¹⁷ Coomaraswamy, HIA, Fig. 136; 'Elements of Buddhist Iconography', Pl. I. Figs. 2, 3.

¹⁸ The *Āmalaka* functions as a ring in relief representations at Nāgarjunakoṇḍa (ASIAR, 1935-36, Pl. XXX. c-e). This *Āmalaka* ring is slipped over a composite symbol, which has the shape of a Makara on one side of the ring, and of a lion (siṃha) on the other.

neck (grīvā, gala, kaṇṭha; see however also Fig. d. where the Āmalaka is missing) which seems to emerge from the shoulder course (skandha), the uppermost course of the trunk of the Śikhara (Pl. I). This presupposes a central shaft (Parts V and VII) which having traversed the entire body of the Prāsāda would emerge above it, support, and be rivetted in, its crown, the Āmalaka. As a clasp and ring-stone, the Āmalaka would be a 'naturally perforated' stone alike in this respect to the 'svayamātrṇās', the naturally perforated 'bricks' in the centre of the Fire Altar. There, they had been placed in vertical succession, the third and last of them upon the centre of the completed fifth, or uppermost layer of the Agni.

The superstructure of superimposed and diminishing slabs of stone forming a stepped pyramid surmounted by an Āmalaka is a pristine type of the superstructure of the temple. In decreasing size, slab upon slab are placed on the roof of dolmen type shrines in South India and the Himālayas as well.¹⁹ In its stratification is repeated the horizontal theme of the base, where the walls of the Garbhagrha are raised on the Adhiṣṭhāna.

IA. 2: THE STRAIGHT TRUNK WITH ROUND EDGED SLABS

The slabs, placed one on top of the other, have either straight, vertical edges or the edges are moulded in the shape of a roll cornice or eaves. The lower slab of the Mahākūṭeśvar pavilion has a slightly rounded edge. Its curve is that of the eaves of a thatched roof in miniature. All the varieties of cornice mouldings of the horizontal courses of the superstructure have such eaves for their prototypes. It was in this shape that the steps of the pyramid of the superstructure of the Prāsāda were to be perfected and to enter into new alliances in the centuries; the more austere form of right angles had less elasticity.²⁰

Two different building traditions contributed to the pyramidal superstructure whose stratified courses have rounded edges. The underlying shape belongs to stone prototypes. Slabs in diminishing size are placed on the flat roof slab of the dolmen type. Their added weight keeps the roof in position. It cannot be moved; the supernatural presence enshrined should by no means escape.²¹ The slabs, being placed on top of the walls and on the flat roof, became assimilated to roof forms. They were given the shape of the curvilinear eaves of the thatch; cornice mouldings

¹⁹ Whitehead, 'The Village Gods of South India', Pl. IX; Liṅga shrines near Hardwar.

Nandi Maṇḍapas etc., in different parts of India, have frequently a stepped pyramid of slabs for their roofs, for example the pavilion of the Vaital Deul, Bhuvaneśvar, Orissa, or the Nandi Maṇḍapam of the Viśvanātha temple in Khajuraho; another in Ekteśvar, Bankura, Bengal; a representation of a corresponding temple shape on the Ashrafpur Bronze Caitya, Bengal, of the seventh century (S. K. Sarasvati, 'Temples of Bengal', JISOA, Vol. II. pp. 130-40); pavilion of the Baijnath Temple, Kangra, 13th century, etc.

²⁰ Temples No. 10 (Fig. b) and also No. 7, Aihole (Cousens, op. cit. Pls. XIX, XXI), combine the slab-type (I A) with the storeyed superstructure I B; note 30.

²¹ A similar explanation is given to this day at Bodh-gayā in reply to the question why the tombs of the Mahants near the temple are in the shape of stepped pyramids of considerable size.

of great antiquity and derived from its curves²² were adapted to the relatively narrow slabs and formed their edges (Fig. c). They softened the hard contour of the original stepped pyramid. A seemingly unbroken outline results of the pyramidal trunk of the superstructure.

The approximation of the horizontal courses of the superstructure to a particular roof form once having been achieved further varieties were adopted; in each particular instance however one kind only is chosen as the theme and repeated in the several tiers of the superstructure. While the roll cornice moulding gained widest currency in the earlier temples, eaves with a double flexed curve subsequently became used in the same way.²³ Their edge is frequently flattened out into a fillet and preserves the memory of the edge of the horizontal stone slab.²⁴

With the introduction of the curve of the eaves of the thatch into the straight edge of the horizontal components of the superstructure, gaps enter their layers and alternate with the variegated profiles of the horizontal mouldings. These gaps are given different height and depth in the single superstructures; as a rule they are deep and narrow and their effect is that of dark bands of shade which cut into the mass of the superstructure without breaking its continuity. Seen across the corners, air and space have entered its solid pile, alleviate it and enrich its slanting and curved profiles with shades, delicate or strong.²⁵

The superstructure develops with the logic of form destined for one purpose. Into this monumental shape, roof forms spontaneously enter; eaves and slopes are adjusted to the levels of the massive pile. Although a fully developed superstructure of the highest kind has not more than 16 Bhūmis,²⁶ each of these may contain

²² The Kapota or roll cornice is frequently carved on the façades of rock cut Caitya halls, for instance at Karle. Its outline is that of a quarter circle approximately. (P. Brown, 'Indian Architecture', Pl. XIX. Fig. 2). This cornice, in structural buildings of stone, serves as a dripstone.

²³ This is an extreme possibility to which the shape of the roll cornice lends itself, being an accentuation and protraction of its lower edge which is halted by a fillet. This particular shape of the eaves appears to have been completely evolved in stone architecture and not in the thatched prototype, although in an initial stage the flexed curve belongs already to the dome of the Fire chapel in Sāñci. It occurs for instance in the 'Old Jaina temple' at Paṭṭadakal (Cousens, 'The Chalukyan Architecture', Pl. LIV, above the door of shrine and Maṇḍapa, but not in the earlier Cālukyan temples, Virūpākṣa Temple at Paṭṭadakal, Pl. XL; Malegitti Śivālaya, Bādāmi, Pl. XXIX). As can be seen in these buildings the end of the overhanging thatch when translated into stone looked abrupt; its form subsequently was softened, the one steep and heavy curve was given a gradual descent and its downward slope became upheld and balanced by a counter-movement. This shape, moreover, was evolved simultaneously as a profile of the base of the temple, and is known in Vāstu-śāstra as Padma or 'lotus petal'. The roll cornice or Kapota retains its name in the various phases of transformation and it also becomes one of the profiles of the base; see Pl. II, 'Essay on the Architecture of the Hindus' by Ram Raz, London, 1834.

²⁴ Aihole, Temples 37 and 38; Cousens, op. cit. Pl. XXV; the superstructure of the Piṛhā Deul, i.e. the Maṇḍapa, of Orissan temples, from about the tenth century.

²⁵ The 'Old Temple' at Visavada, Kathiawar (see p. 155) is one of the most elegant solutions of this kind. Together with the slope of the roof, dormer windows (gavākṣa) have become part of each stratum of the superstructure. The association of the superimposed slabs of stone and the roofs of houses is now complete.

²⁶ i.e. the type 'Meru' according to the 'Bṛ. Saṃhitā', etc. The Bhūmi, originally of one horizontal unit only, soon consists of two or three mouldings. The third course is carved in

a number of roof-edge mouldings, six for example, the number remaining the same in all the Bhūmis, so that ninety-six similar horizontal profiles enliven its courses. With such a number of superimposed roofs no actual building ever rose. Double and triple roofs are frequent in actual buildings; Vāstu-śāstra knows of their employment as Dvichādyā, etc. ('Samarāṅgaṇasūtradhāra', XLIX, etc.).²⁷ The house of God is other than the houses of men, their roofs are but mouldings and lines of its superstructure and designate its levels.

The pyramidal superstructure of diminishing horizontal slabs whose edges assumed the curves of different roof shapes is widely distributed in India, although not many temples with this kind of superstructure of the Prāsāda now exist.²⁸ The

the likeness of an Āmalaka in its corners, and designates the sum of the three courses as one complete sub-śikhara, or one Bhūmi (Temple IX, Aihole, Fig. 4; in Pl. LXXI, three strata are crowned by an Āmalaka). The Liṅgarāja temple at Bhuvaneśvar has 6 strata in each Bhūmi.

²⁷ See Pt. VII, note 86. A Dvichādyā building is for example the Maṇḍapam of the Paraśurāmeśvar temple, Bhuvaneśvar; or that of the Uttareśvar temple, both dating from the 8th century; also Temple No. 11, Aihole (Cousens, op. cit. Pl. XXIII) and other buildings in Aihole. The Jagamohan or Maṇḍapam of the Siṃhanātha Temple, Baramba State, Cuttack, is a Trichādyā building (ASI, Bihar and Orissa photograph, No. 5504 of the year 1941-42). Cf. also Part V, note 54.

²⁸ The pyramidal superstructures of the temples at Visavada, Bileśvara, etc., in Kathiawar, are so constituted (Cousens, 'Somanātha . . .', op. cit. Pls. XLIII-IV, XXXVII).

This type of the superstructure is represented not only on a relief of Gupta age, at Sārnāth (Fig. c) but also for example, on a lintel at Khajuraho, of the tenth century (B. L. Dhama, 'A Guide to Khajuraho', Pl. XI. b). The transformation of the Āmalaka and of the Gavākṣa in these two relief representations dates them as unmistakably as the change from the still full curve of the single 'roofs' in the earlier example and their stretched, attenuated version in the later type. The pyramidal superstructure composed of tiers and crowned by an Āmalaka is frequently carved on relief slabs and on lintels, pillars, door-jambs, etc. of temples. Small shrines or chapels housing the image of a god are thus represented in relief in Nālandā (Façade of main shrine, Caitya site 12, ASIAR, 1930-34, Pl. LXVII d), in Bengal (in Pāla paintings) or in Central India (Udayapur) etc. They must have had their structural prototypes in Bengal, Bihar, the United and the Central Provinces, etc. throughout half a millennium and more.

The Pīrḥā Deul or Bhadra 'temple', i.e. Maṇḍapas or also gateways of Orissan temples are the most widely employed buildings with this type of superstructure. It appears to have suffered a degradation in Orissa, its place being, as a rule the Maṇḍapa or other auxiliary building of the temple, but not the Prāsāda itself. The name which denotes the horizontal courses of this superstructure is Pīrḥā, a 'flat wooden seat' (N. K. Bose, op. cit., p. 185).

The "Bhāskareśvar" temple in Bhuvaneśvar (M. M. Ganguli, 'Orissa and her Remains', Pl. XV. a; this temple, however, is generally known under the name Megheśvar) is an exception for its Prāsāda is a Pīrḥā Deul, though the outline of the Śikhara is curvilinear. This temple represents one of the 'transition' types from the straight to the curvilinear shape of which the Mahendragiri temples of the 10th century are earlier and somewhat different examples in Ganjam (ASIAR, 'Southern Circle Report', 1915-16, Pl. XI, p. 35). The "Bhāskareśvar" temple in its present form belongs to a late phase amongst the temples of Orissa.

The Prāsāda of certain temples in Mayurbhañj State built after the 16th century has a superstructure of the 'Pīrḥā' type ('Archæological Survey of Mayurbhañj', Vol. I. pp. 56, 64).

Not only in Kathiawar, Mayurbhañj, Orissa, Ganjam, etc. does the pyramidal superstructure rise above the Garbhagrha proper of temples still in existence, but also in the Kanarese Districts of the Deccan and in the adjacent country. They have been taken to represent the "Kadamba Style" (Moraes, 'The Kadamba Kula', Part VII); temples of this kind are also in Aihole (Cousens, 'The Chālukyan Architecture', Pl. XXV; temples of Galagnāth and Nos. 37 and 38), Vijayanagar, etc.; their pyramidal shape however is often deflected into a curvilinear outline (Gravelly-Ramachandran, 'The Three Main Styles of Temple Architecture', Pl. I. Fig. 2).

THE SUPERSTRUCTURE

carved pattern formed by its layers of mouldings alternating with dark bands of shadow, was to be cast also on Type II of the superstructure, the Śikhara with curvilinear sides.

The pyramidal superstructure composed of narrow horizontal tiers, originally various types of roof edges, cornices or eaves, has several further varieties.²⁹

IB: THE PYRAMIDAL SUPERSTRUCTURE COMPOSED OF STOREYS (BHŪMI)

IB. 1: THE STEPPED TRUNK OF THE PYRAMID FORMED OF SINGLE STOREYS

The other main variety of the pyramidal superstructure is divided into broad horizontal parts each of which represents a storey of a building. This superstructure is a counterfeit of an edifice; it is set as a whole on top of the vertical walls of the Prāsāda. Two varieties of this type are specially clear. The one (IB.1) is represented by few preserved temples only like those of Bodh-gayā or at Sārnāth;³⁰ their gradually receding storeys have each a row of niches in relatively low relief against their compact walls. The other architectural features, Gavākṣas, etc. of this high superstructure are also carved in low relief and alternate in parallel courses with the rows of niches (cf. Fig. b).

The storeys recede imperceptibly; an Āmalaka moreover, is placed on each corner of each tier-like storey. The composition of this high pyramidal mansion if visualized without any of its sculptural details, without the corner Āmalakas especially and by giving to its abbreviated storeys proportionately greater height, would resemble the stepped pyramid of the Sat Mahal Pāsāda in Polonnaruva, Ceylon, of the 12th Century. No such type is preserved in India itself. The stepped pyramid here, as also in type I A, appears to have been less frequently employed than the pyramid with a seemingly unbroken edge. The latter type however is based on the stepped pyramid and this fact is never completely disguised. This variety of the pyramidal superstructure (IB. 1), shares with the more complex

²⁹ The pent-roof of laminated boards for instance, lends its slope to the superstructure of the temple at Gop, of Gupta age, in Kathiawar, and to the temples of Kashmir (Temples at Pandrethan, Payar, etc. ; 8th century).

³⁰ JISOA, VI. Pl. XXIV ; Pl. XXIII shows 'A Miniature Replica of the Mahābodhi Temple' (pp. 78 f. in an article by B. Rowland Jr.).

The conjectural restoration in the drawings on Pls. XXXI and XXXII of P. Brown's 'Indian Architecture' conveys roughly the disposition of the storeys. On a smaller scale, and combined with alternating projecting tiers of the slab roof profile, are Temples 7 and 10 in Aihole. The crowning part of these temples might have been an Āmalaka ; as such it appears in the restoration of the Bodh-gayā temple ; corner Āmalakas support the shoulder course of temple No. 10, Aihole (Fig. b).

In this superstructure the narrow courses with their cornices represent flat roofs above the broader courses representing a storey each whose walls have niches.

variety (IB. 1-3) the nucleus only, the superimposed wall-prisms in receding storeys.³¹ Carved with many niches and pilasters on each of the four sides it is an effigy of a storeyed mansion, placed on top of another large building with straight walls.

The pyramidal superstructure with closely set receding tiers (IA) had its beginning in the strata of diminishing superimposed slabs. The pyramidal superstructure with receding storeys on the other hand has its beginning in the superposition of a complete storey of the type described (Fig. b) or of a much simpler type consisting of a cell only on top of another building with upright walls and having one floor only. This can be seen in the cell put perpendicularly on the flat roof of the Gupta temple dedicated to Pārvatī in Nachna Kuthara, and also in the Kuraja Bir Temple near Jhansi which is of later date; similarly also the small shrine of Sūrya, is placed on top of the temple known as Lad Khan in Aihole. These flat roofed cells, remotely of dolmen type, are actual sanctuaries with an interior space; they have not yet consolidated into the exterior only of a compact monument. The principle, however, of piling one complete building, however simple, on top of another remains the same, in the artless combinations and in the compounded solidity of the storeyed, pyramidal superstructure.

The Sat Mahal Pāsāda in Polonnaruwa, Ceylon, is an authorised translation from stone into brick and an enlarged version of the dolmen type raised to the seventh storey on a stepped pyramid composed of similar shapes.

IB. 2: THE "HIGH TEMPLE" (KSUDRA-ALPA-VIMĀNA)

Differing from such consolidated mansions are the superstructures of the temples in the Kanarese districts³² and throughout that part of South India generally known as Drāvīda. There in the large temples (jāti vimāna; mukhya vimāna), an entire mansion of pyramidal appearance is placed on the vertical walls of the Garbhagrha (IB. 1). Each storey of this pyramid however consists of the one central building plus a series of small buildings surrounding the walls of the

³¹ The crown of the superstructure seems to have had the shape of the Āmalaka and in this respect it resembles type IA. Intermediate types, like Temples 10, etc. at Aihole (Fig. b) show the drawing from one and the same reservoir of types. Āmalakas occupy the corners, if not of each storey then at least of the highest layer below the top slab. The Āmalaka, a broad and flat shape, on a high neck is shown also on the high pyramidal trunk of the shrines represented on clay seals from Nālandā, of about 1,000 A.D. (Gurudas Sarkar, 'Notes on the History of the Sikhara Temple', Figs. 12, 14, 'Rūpaṃ', vol. III).

³² As far as preserved monuments go, these date from an earlier age than the structural and also the rock cut temples of South India; the Mahākūṭeśvar Temple which was in existence before 600, was probably built in the third quarter of the sixth century; more ancient than the well preserved temples are the ruined Kont Gudi temple, and three others near it, in Aihole. In South India, the rock cut temples at Mamallapuram are of the mid-seventh century and the earliest of the preserved structural stone temples were built subsequently, from the later part of the seventh century onwards.

The temple of Mahākūṭeśvara has a rampart of chapels in the second storey, another rampart of chapels closely adheres to the third storey; the dome is stilted and has eight sections.

central building (IB. 3; Figs. f-g). The small one-storeyed buildings, aligned in a row serve as a kind of parapet at a given distance from the walls of the main building with its pilasters and niches. The small cottages, cells or chapels which are linked so as to form an enclosure wall or parapet of each single storey alternate in shape; they are square and capped by a dome or rectangular in plan and waggon vaulted; the former type, called *Kūṭa*, is invariably placed at the corners of the respective floor (*bhūmi*); its top has the appearance of a dome in four or eight sections (Figs. f, g).

The small High Temple above the shoulder course (*skandha*) in which the superstructure culminates (IB. 2) is reminiscent of the simple shrines represented in the reliefs of *Barhut* and *Sāñcī*. Placed on top of the trunk of the pyramid, the walls of this High Temple form here the neck (*grīvā*) of the crowning dome, the 'Sikhara'.³³ The 'walls' of this ultimate temple are alike in their position and function to the shaft (*grīvā*) by which is upheld the *Āmalaka* above the curvilinear *Sikhara*. Here too, in the pyramidal superstructure of superimposed *Bhūmis* the shaft, be it round, square or octagonal, appears as if emerging from the *Prāsāda*, as if it were stuck across it from the base to the crown. This visible part of the shaft in which is sheathed the vertical axis of the temple is formed here by the walls of the domed shrine.

If the flat roofed cell was the simplest type of a building which had been piled along the vertical axis, and with its flat roof lending itself to repeated superimpositions, the small 'High Temple' or *Vimāna* with its dome is another type of building or temple which was raised on top of a flat roofed building. A domed shrine, the prototype of the 'High Temple' of the South Indian temples is for example the *Nāga* or Fire chapel represented in one of the reliefs at *Sāñcī* (1st century B.C.), Central India; aggrandised and consolidated in its architectural form is the rock-cut *Draupadī Ratha* at *Mamallapuram* (seventh century A.D., South India); with its curvilinear roof in four sections it is another model of this type of one-storeyed temple. It appears in relief representations—raised as a whole and placed on top of another prismatic flat-roofed sanctuary—and also in extant temples of *Pallava* and *Cola* age, in South India, such as the temple at *Enadi* (Fig. e).³⁴ It exemplifies the "Small" South Indian temple (*alpa-Prāsāda*) and is without the rampart of

³³ The meaning of the dome is given by Coomaraswamy, 'Symbolism of the Dome', 'Indian Historical Quarterly', Vol. XIV.

The piling of one shape of temple upon the other as its superstructure is the subject of chapter LV of the '*Samarāṅgaṇasūtradhāra*'. The superimposed temples may be square in plan or circular, etc. their vertical sections also are different and each type has its name, such as *Rucaka*, etc. "Rucaka or *Vardhamāna* or *Śrīvatsa* or *Hansa*, whichever one may like among them, one should set up that on *Garūḍa*" (SS. LV. 79).

A small High temple is raised not on a pyramidal superstructure, but on a pyramidal substructure consisting of terraces, in *Ahicchatra*. The single terraces have each a rampart; there are however no chapels and the open air ambulatory is between the central part or block of masonry on each terrace and the rampart of that terrace.

³⁴ *Pallava* relief in *Undavalli*; A. H. Longhurst, 'Pallava Architecture', Mem. A. S. I. No. 17. Pl. XIII; in *Mamallapuram*, in the *Gaṅgāvataraṇa* relief; Coomaraswamy, HIIA, Fig. 198; further elaborated temples of this kind are carved in relief in the gable ends of the *Bhīma* and *Sahadeva Rathas* in *Mamallapuram*. *Siva* temple at *Enadi*; 'Cola Temples in *Pudukottai*' by Venkataranga Raju, JISOA, vol. V. Pl. XI.

chapels. The actual date of these developments is not ascertainable from the above examples. About half a century earlier than the Pallava representations, the culminating chapel, with its dome, crowns some of the fully preserved temples of the Kanarese country; there it is not raised to the second storey only but to the third, fourth or fifth.³⁵ In these temples too, another component, the rampart of chapels (IB. 3), has been incorporated whose origin is still discernible in South Indian temples of the Pallava age and is dealt with below.

The origins of the consolidated varieties of the superstructure are manifold, the dates of their entry and participation in its body are not known. Their sequence must be reconstructed although architectural solutions which must have preceded derivatory forms are not infrequently preserved in actual buildings some centuries younger than the diverse and derivatory applications. This is only partly due to accidents of preservation, but is itself a symptom of the course of history in India. The original theme remains, either in its pristine or else in its highly evolved form; development is here tantamount to exposition. A form giving the fullest exposition to the meaning it conveys may be contemporary with the nucleus of its meaning represented in elemental terms (Cola temple at Ēnadi, Fig. e) on the one hand, and at Tanjore (Fig. h) on the other or else is even outlived by the original, elemental form (for instance the fully evolved temples of the type of the Saṅgameśvara at Paṭṭadakal, Bijapur District, of the early eighth century; and the above mentioned tenth century temple in Ēnadi in Pudukottai).

This happens irrespective of schools or regional developments as instanced by the above examples. Every age, every province, every school and architect give their knowledge to the task of building the Hindu temple; the forms and their connections in which its meaning is inherent remain pregnant with it all the time; and some of them remain unchanged. The flat roofed, one storeyed Pattainī Devī temple at Unchahara in central India, for example, has one monolith for its roof slab. Its actual date is about the year 1000 A.D., its form that of the 'flat roofed Gupta temples'; the construction of its roof is megalithic. But so is also that of the top of the many storeyed superstructure of the Great Temple at Tanjore, about 1000 A.D. (Fig. h). It is a single block of granite, 25 feet square.³⁶

³⁵ Mahākūṭeśvar, 6th century; Malegetti Śivālaya, Bādāmī, 6th century; Temple of Saṅgameśvara, at Paṭṭadakal, 696-733 A.D.; half a century later, the Virūpākṣa Temple, and others at Paṭṭadakal, Cousens, *op. cit.* Earlier temples than these, though destroyed in the upper part, are in Aihole.

³⁶ J. M. Somasundaram, 'The Great Temple at Tanjore', p. 9. The author rightly calls the octagonal cupolic dome a Śikhara. The 'Īśānaśivagurudevapaddhati', in Part III. ch. XXVIII. 34-39, moreover defines the Kūṭa, Koṣṭha and Pañjara—these are the single miniature replicas of buildings, shrines or chapels, set along the edge of each of the 'storeys' of the South Indian temples—and discusses the shapes of their roofs (śikhara) which are vaulted or domed.

K. R. Pisharoti, 'Śikhara', 'The Annamalai University Journal', vol. V. No. 2, treats of the Śikhara, i.e. the superstructure of the Garbhagrha; it may be called the 'head' of the Vimāna or Prāsāda; this is substantiated in Vāstu-śāstra which knows the temple as the concrete form and body of the Puruṣa (cf. also Pt. V, note 66).

The South Indian Śikhara supports the Śikhā, the finial above the miniature 'High Temple', the 'kṣudra-alpa-Vimāna'.

Śikhā is the skein of hair on the crown of the head, where lies the Brahmarandhra, the threshold of Brahman. It is there that the last immanent breath leaves the body at the time

IB. 3: THE ENCLOSURE OF CHAPELS

Different from such unchanged survivals in the body of temples themselves representative of different stages of evolution are certain other forms one of which, the rampart of chapels (IB. 3), is of the greatest interest. The rampart or wall made of single shrines or cells, even in the earliest preserved temples of Aihole, is a compact and diminished replica of its structural form (Kont Gudi Temple); it has become by the seventh Century the general pattern of the parapet on a flat roof (Pāpanāth Temple, Paṭṭadakal; and contemporary rock cut representations in South India); its compact, contracted and abbreviated version points back to a distant past, when every single shrine in such an alignment had played its part in the total sanctuary or sacred precinct, enclosed by and consisting of contiguous chapels. Certain Pallava temples though of later date (700 A. D.) represent an earlier stage in the history, nearer to the original function, of the enclosure made of chapels.

In a fully evolved South Indian temple or Jāti Vimāna of about 1000 A.D. the high pyramid of the Bhūmis of the superstructure rests upon upright walls in which is encased the Garbhagrha. They are frequently given the appearance of two storeys, one perpendicularly above the other as in a vast building with many niches (ghanadvāra), flanked by pilasters in each storey and a heavy cornice moulding, the eaves, above each (Fig. h.). Both these storeys occupy the same floor space and together they form the perpendicular walls on which is placed the pyramidal superstructure. The storeys of the pyramidal superstructure are comparatively on a miniature scale but they too have their niches and pilasters. In front of them, however, on each floor on all the four sides, is a series of small chapels or cells, oblong or square, and vaulted or domed, correspondingly (Figs. f-h). These chapels are called Kūṭa and Koṣṭha, etc.; placed close to the cornice of each storey they fill the gap between the receding tiers and give the outline of the superstructure the appearance of leading straight and unbroken from its base to its shoulder course.

If an original building is imagined of which every single storey forms a large square hall (cf. IB. 1) and not a humble cell, and which, moreover, is surrounded by a number of closely set small buildings, all in a row and at a given distance from the main hall (Fig. f) this would be the prototype of each single storey of the pyramidal superstructure prevalent in the larger temples of the Drāviḍa and Kanarese countries. Little if anything has been preserved of earlier 'structures' thus laid out except descriptions by Fah Hian and by Hiuen Tsiang of Buddhist monasteries.³⁷

Other Buddhist monasteries built of stone, consist solely of a row of cells forming a quadrangle; Buddhist sanctuaries made up similarly of a row of variously shaped chapels surrounding a Stūpa as the main sacred object in the court formed of chapels, have been preserved in Gandhāra, at Takht-i-Bahai, and also in

of death. The 'Bṛhadīśvara Mahātmya', XV (Somasundaram, op. cit. p. 40), tells of the Brahmarandhra of the Great Temple at Tanjore which was closed by the huge monolith.

³⁷ Fah Hian, quoted by Fergusson, HIEA, vol. I. p. 171, the rock-monastery having 500, 400, 300, 200 and 100 cells in the successive storeys respectively.

The name for Buddhist monastery is Vihāra; Vihāra originally denotes sacred ground and seems to have been used in this sense, the cells marking its enclosure or limits.

Jamalgarhi where the court is circular. Cut into the rock, the Buddhist monasteries in India show an alignment of single cells without architectural pretensions, along the sides of a square hall. This is the general arrangement of rock-cut Buddhist monasteries, from about the second century A. D. onwards.

The plan of the rock-cut Buddhist monasteries in Ajanṭā, Nasik, etc., does not differ in principle from the stone built Buddhist monasteries in Gandhāra. These again conform, as in the Takht-i-Bahai establishment, with the sanctuary, 'the court of the Stūpa', with only that difference that there the single cells house images and that in the court is the main object of worship. Was it the organisation of monastic life which found a suitable type of dwelling and set up its sanctuaries in a similar manner? Or did the Buddhists adjust to their mode of worship and monastic life a form of religious architecture already in existence? The Gandhāra example represents an open air architecture; a row of cells surrounds a court; their alignment is at the same time its enclosing wall. A monument may be set up in the middle of the court, or not. This open air architecture is not suitable for the cold winters in Gandhāra and has not been evolved there either. The rock cut monasteries in India itself, with their central hall are identical in plan; retranslated into structural terms and set up in the open they would have consisted of a row of cells surrounding a central court.³⁸ The Buddhists generally adjusted for their own purposes types of architecture already in existence.

Though not preserved from an early age, the open-air or hypaethral temples³⁹ in existence consist for example of a row of single cells, each housing an image of one of the 64 Yoginīs; the cells surround an open court, which is either empty or has its centre marked by a small pavilion.

None of the preserved Cauṣiṣath Yoginī temples is earlier than the ninth century A. D.; the one in Khajuraho in central India encloses a rectangular court, whereas at Bheraghat, the hypaethral Cauṣiṣath Yoginī temple with its 81 chapels providing also for the images of subsidiary divinities and also the Cauṣiṣath Yoginī Temple at Rānipur Jhoriā, in Patna State, forms a circular enclosure. In its centre is a small Chatra or pavilion on four pillars; an image of Śiva is enshrined in it; the images of the Yoginīs, each in its chapel or cell of the enclosure, face towards it. The Bhimsen-ka Akhara in Dudahi, Jhansi, a circular cloister of 64 cells is without a central structure.⁴⁰

Another variety of the hypaethral temple belongs to Bengal. Two groups of 108 Śiva temples were built by the Burdwan-Rāj about 150 years ago, one at Kalna, Burdwan, the other in Burdwan itself. The 108 chapels form the boundary of an

³⁸ The slow evolution of the rock-cut monastery from a hall without cells immediately attached to it, to a hall with a few irregular cells attached to it, to a hall with a few irregular cells opening into it on one side or the other, and to the final result described above does not go against the above assumption. The excavation of sanctuaries and solitary retreats preceded establishments of rock-cut monasteries on a large scale.—The stūpa of Takht-i-Bahai is not in the centre of the court, but lies on its N-S axis (ASIAR. 1907-8, Pl. I.).

³⁹ "The village shrine in its most primitive type is always hypaethral or open to the sky", W. Crooke, 'Religion and Folklore in Northern India', p. 89.

enclosure, circular at Kalna and rectangular in Burdwan. They are built in the usual Bengal style. The doors open into the court which has no other structure built within.⁴¹ Similar temples are also in Calcutta; they represent an ancient and perennial type of sacred architecture.⁴²

This type of open air temple appears to be the basic form of the Court of the Stūpa, at Takht-i-Bahai. But it is also preserved in the surrounding wall of cells of some of the great temples set up by the Pallavas in South India; the Shore Temple at Mamallapuram (Fig. g) and the Vaikunṭha Perumal Temple being the youngest (710 A. D.). Each of these large temples with its accessory buildings is surrounded by a wall of chapels.⁴³ Apart from this enclosure of the whole precinct, another corresponding row of chapels surrounds the Prāsāda itself. In the Shore Temple it has the form of a wall of cells separated from the body of the temple by an open air passage (Fig. g). In the Kailāsanātha Temple however, another great structural temple of about 700 A. D., at Conjeeveram, the single chapels of the enclosure, are attached to the walls of the Prāsāda from which they are seen to project,—also in the rock-cut Kailāsanātha Temple in Elura—, whereas in the Vaikunṭha Perumal Temple they are altogether embodied in the temple of which they form part of the outermost but covered ambulatory.

These various solutions are stages in a process of drawing towards the Prāsāda the enclosure wall of the chapels and incorporating it. Nearest amongst south Indian temples to the original open-air type is the Shore Temple. The Prāsāda occupies the place of the Stūpa as in Takht-i-Bahai or of the central Śiva image in its pavilion, as in Rānipur Jhorial.

The Garbhagrha ensconced in these temples does not cover more floor space than a pavilion, but it was the purpose of the Prāsāda to be large and to reach to the clouds. The Garbhagrha by its nature is, and at all times remains, the small secret chamber. By the same desire its secretedness became enhanced in the great temples and the floor space of the Prāsāda became enlarged by covering the circumambulatory. According to Vāstu-śāstra, the temples covering a large floor space are Sāndhāra, which means they have an internal circumambulatory so that the Garbhagrha has its walls encased in a second series of walls; this is the rule.⁴⁴ Above the broader base thus gained for the vertical walls, the superstructure arises

⁴¹ I am indebted for this information to Dr. Jitendranath Banerjea.

⁴² Other hypaethral temples although without chapels as for example the Trimurti Kovil, Annamalai Hills, Koimbatour, with its circle of images facing inward, are backed by a low wall (Sir Walter Elliot, in 'Indian Antiquary', VII. p. 137). The sacredness of an enclosed courtyard, open to the sky and containing images is also familiar to the Jains in their 'Betta'. Such enclosed courts with their images are cognate with the several enclosures (prākāra) and their images which surround South Indian temples (cf. 'Vaikhānasāgama').

⁴³ They face the temple and, as in the Vaikunṭha Perumal Temple, form one continuous, pillared cloister; on the outside however, the wall is shaped in the likeness of a row formed of single cells, complete with their roofs.

⁴⁴ Various examples of the internal circumambulatory date from the Gupta period; the temple at Gop, the Śiva temple at Bhumara, the Pārvatī temple at Nachna Kuthara; cf. also the 'Brhat-Saṃhitā' and other texts.

The Vaikunṭha Perumal Temple at Conjeeveram has two internal circumambulatories (Bhramantī or Ramanī, Andhakārikā, Andhārikā or Pradakṣiṇā; 'Samarāṅgaṇasūtradhāra', LVII. 114. 548, etc.) on the ground floor.

in its full volume. So there is the small sanctuary encased in its walls and having an inner enclosed circumambulatory or two even and, as in the Shore temple and the Vaikuṇṭha Perumal an outer one, in addition in the open. Further, there is the enclosing wall composed of cells of the entire temple precinct. The rites of circumambulation and the rite of 'enclosing' the more than human presence have their architectural equivalent in the walls of the circumambulatory ; to enclose the presence, and also the path around it, not only on the sides but also to cover its top, is logical for the central sanctuary, the Garbhagrha itself, in principle, is closed on top like a dolmen.

While the Drāviḍa temples incorporate the theme of the hypaethral temple, the enclosure formed of chapels, in the body itself of the Prāsāda, the enclosure of cells around the main temple, belongs to some of the great shrines in distant parts of India, such as the Virūpākṣa temple in Paṭṭadakal, or the Navaliṅga temple at Kukkanur (Gadag),⁴⁵ in the Kanarese country, the Keśava temple at Somanāthapur in Mysore,⁴⁶ and, in Kashmir, the Sun temple of Mārtāṇḍ and the Avantisvāmī temple in Avantipur.⁴⁷ Amongst Jain temples that of Vimala Shah, A. D. 1031, on Mt Abu, the Nemināth Temple at Girnar, Kathiawar, or the Chaumukh Temple at Ranpur,⁴⁸ Jodhpur, built by Sūtradhāra Depaka in 1440 A.D. are cloistered by a range of cells, each a shrine with an image.

On the Malabar coast, a pillared cloister, the Nālambalam, a wooden structure, encloses the several buildings of which the temple consists.⁴⁹

The hypaethral temple survived also in another shape. Instead of a contiguous range of chapels a number of separate temples may form an enclosure around a central shrine.⁵⁰

In the 'South Indian' temples however of the Kanarese districts in the Deccan, and in the Drāviḍa country, the full range of the cloister built of chapels becomes incorporated in the body itself of the Prāsāda.

⁴⁵ Cousens, 'The Chālukyan Architecture', Pl. LII. The Navaliṅga temple is about three centuries younger than the Virūpākṣa temple.

⁴⁶ P. Brown, op. cit. Pl. CVII. The date of the temple is 1268 A.D.

⁴⁷ These temples were built in the eighth and ninth centuries A.D.

⁴⁸ ASIAR. 1907-8, Pl. LXXX.

⁴⁹ The temple of Thirunandikkara, of the 13th century. The temple of Vaikom, dated 1534 A.D., both in Travancore.

⁵⁰ Eight such subordinate temples surround the central temple in Sirpur, the four in the cardinal directions being larger than the rest (ASI. vol. VII, p. 175 f) ; a composition of eight temples was the original form of the Śiva temple on Melamalai, Narttamalai, Pudukottai, of the ninth century (see plan, Part VII), and of the Nilakanṭheśvara temple at Udayapur (ASI. ib. p. 82), etc. and of the Koṭheśvara Temple at Pathari of the ninth century. The rock-cut temple at Damnar (Rajputana) belongs to this group.

Further reduced in the number of the shrines forming the enclosure is the composition of temples called Pañcāyatana in which 4 separate shrines, each in a corner of the enclosure, surround the central shrine. This grouping is frequent in northern India and the Deccan ; the following are some of the representative Pañcāyatana temples. Three different groups of Pañcāyatana temples (two of Hari-Hara, 8th-9th century, one of Sūrya of a later date) at Osian, Jodhpur, Rajputana ; the Gondeśvara Temple, at Sinnar (Nasik) ; at Khajuraho the temples of Viśvanātha and of Lakṣmaṇa (see Part VII), the Brahmeśvar Temple in Bhuvaneśvar and at Mukhaliṅga (Ganjam), the Mukhaliṅgeśvara Temple.

The integration of the enclosing walls only of the ambulatory in the body of the Prāsāda, however, is also an all Indian development. A temple having an internal Pradakṣiṇa is called Sāndhāra. In South India however the enclosing wall had a greater tenacity than elsewhere in the country, on account of the importance with which it was vested. The principle of 'enclosing' is as strongly in force in the Vāstu-maṇḍala of the type Sthāṇḍila or Padmagarbha with its several rigid zones, as it is in the structural Prākāras or Āvaraṇas, the high walls which enclose a South Indian temple.

The enclosure, be it a wall only or a contiguous series of cells, is an essential part of the South Indian temple in its fully evolved form. Its delimiting function makes the sacred precinct a 'temple' and keeps alive the meaning of the Sakala plan in a Vāstumaṇḍala of many divisions. These are observed in South India in their concentric rigour. They are allotted to Brahmā in the centre, to the gods in the immediately surrounding zone, to men in a further zone and to the demons in the outermost rim. Conforming in principle with this triple enclosure, are the seven enclosures of which the full iconography is given in the 'Vaikhānasāgama', etc. The temple of Śrīraṅgam has indeed seven enclosures and if all the 'āvaraṇa devatās' are not to be found therein, they are magically assigned to them by the priest. While other South Indian temples have a smaller number of Prākāras, the only Northern Indian temple in existence which has two enclosing walls is the temple of Jagannātha, in Puri; other Orissan shrines (Mukteśvar, Brahmeśvar in Bhuvaneśvar) have one surrounding wall and most of the North Indian temples are altogether without it; the walls of the main building themselves are its enclosure.

The surrounding wall however belongs particularly to Drāviḍa temples. Thus the enclosure made of chapels too, kept its independent open-air existence while it also came to function as an essential part in the large Pallava temples, the first structural temples built of stone, which were set up in the Drāviḍa country. Finally, it becomes an adornment of the superstructure of the Prāsāda.

This takes place not on one level only, but is repeated on the floors of the many-storeyed superstructure (Fig. f). In receding tiers, a wall of cells forms the continuous parapet above which emerge the walls of the Garbhagrha of that floor,⁵¹ these again carry the parapet of the floor above. An open air circumambulatory is thus provided for each respective floor; it is hidden from view by the parapet of cells (Fig. f; also Fig. g); this in addition to its ritual suggestiveness has monumental effectiveness for the recess of each upper storey, the step of the pyramid, is thus masked, the outline of the superstructure appears unbroken, and enriched by the bold three-dimensional discipline of the domed and vaulted chapel-shapes of its parapets or enclosures.

The introduction of the row of chapels on each floor (bhūmi) of the superstructure fulfils a similar purpose in this larger conception as did the introduction of the curved (IA. 2) eaves of the roof assimilated as they were to the slab type of the pyramidal superstructure (IA. 1), and also the Āmalaka placed at the corners of its Bhūmis (IB. 1).

⁵¹ As in the Vaikunṭha Perumal temple. An actual Garbhagrha however on each floor is not the rule; the structure of the South Indian temple as a rule has the appearance of a massive monument; its interior, as a rule, is inaccessible to the devotee and not meant to be seen.

Here, an entire type of planned architectural form is placed on top of its exactly similar but larger fundament, this procedure is repeated until the extent of the floor is reduced so that the accessory and surrounding buildings of the rampart can be accommodated no longer and only the central small building on the top, the High Temple, remains which is the crown of the monument (Fig. g).

The theme of the pyramid as represented by the Vaikuntha Perumal temple comprises the entire Vimāna. It is logically carried out from the bottom to the top. In the wholeness of its conception this type of the temple, pyramidal in the vertical section, corresponds to the curvilinear type where the buttresses of the ground floor are extended and carried up all along the curved superstructure (Type II). The same constructural wholeness is seen here though with different units of form.

These first structural temples of the Pallavas subsume ancient types of sacred architecture to a comprehensive conception of the Prāsāda. The several original destinations and forms of their constituent parts can still be distinguished. They are the central 'cube' or prism of walls, the rampart of chapels and the 'High Temple', the latter forming the crown of the temple.

In later structural temples (Fig. h) but also in earlier Pallava monuments (Fig. f), preserved in rock cut examples, the entire pyramidal temple is placed as pyramidal superstructure on top of the prism or cube of the perpendicular walls of the ground floor (samsthāna). They encompass the (main) Garbhagrha of which the superstructure (IB. 1-3) consists of storeys (bhūmi).

In the rock-cut Dharmarāja (Fig. f) and Arjuna Rathas in Mamallapuram the total pyramid of this collective type of sanctuary is raised on the high perpendicular walls and pillars of the ground floor. But not only in these rock-cut Pallava monuments is this type (IB. 1-3) of the superstructure condensed into a monument without an internal space; in the structural temples of the Cola age and subsequently it is cut off from the interior of the Garbhagrha by the flat ceiling of the latter. The Vaikuntha Perumal temple, however, with its Garbhagrhas in the centre of each of its four storeys, reveals the original purpose of accommodating a sanctuary in each storey of the pyramidal superstructure to the same extent as does the outer shell of this Prāsāda, from the ground level to its 'High Temple'.⁵² As a rule however and seen from the outside the consolidated trunk of the pyramidal superstructure simulates only a Garbhagrha in each of its storeys (Fig. h).

The paradox is obvious in the history of this type of the superstructure of the temple. The hypaethral temple with nothing in the centre or near to nothing is here amalgamated with a monumental structure in its centre. It towers in each storey above its surrounding enclosure with its many small shrines.

The existence of the Centre, however, whether marked or not, in the hypaethral temple had prompted its enclosure and the demarcation of its perimeter. Not by chance is the number of the Yoginīs and their chapels 64 or, providing for accessory images, 81. They are related in number to the squares of the Vāstumaṇḍala. The central position corresponding to the Brahmasthāna is marked, in Rānipur Jhorial, by the central image in a pavilion; towards the Centre moreover face the chapels and the images of the Yoginīs in each of these hypaethral sanctuaries.

The superstructure, produced by a transfer and elevation of the pyramidal

⁵² Its section in perspective and ground plan are given by P. Brown, op. cit. Pl. LIV.

temple, each of its storeys surrounded by an enclosure or rampart of chapels on the cube or prism of the supporting walls, does not result from a single operation; the paradox of the hypaethral temple, attaining its maximum height by means of a monument in its centre, however, is not the only one in the history of the pyramidal superstructure of South India.

Further paradoxical developments accompany the evolution of this type of the superstructure. The surrounding chapels, it has been pointed out of the ground floor of the Kailāsanāth Temple at Kāñcīpuram, were attached to the body of the building and drawn into the outer walls of the temple circumambulatory.⁵³ Similarly, from the Cola age onward, the parapet of chapels on each floor of the superstructure is attached to its walls; the open air circumambulatory itself a vestigial part of the hypaethral temple, is pressed out of existence. The enclosure of cells is now an embellishment of the wall of each Bhūmi, a sculptural part of the monument (Fig. h).⁵⁴

After the Cola age, moreover, in the course of time, a devolution approximates the total appearance of the central temple to one of its initial forms, such as is exemplified by type IB. 2 consisting of the domed High Temple on top of the perpendicular walls of the Garbhagrha.

The fully evolved pyramidal superstructure having attained its perfect form and greatest height (190 feet) about the year 1000 A.D. in the Brhadiśvara, the 'Great Temple' in Tanjore (Fig. h), loses it in the following periods in proportion to the increasing height of the gate towers, the Gopuras of its enclosure walls. Taken as a whole, the South Indian temple irrespective of the flat roofs of its extensive pillared halls, in the centuries of its greatest expansion (Temple of Śrīraṅgam, 13th-18th century; the temple of Tiruvannamalai, Cola period and later) is a hypaethral temple, an open air sacred enclosure, with high walls, be they as many as seven, marked in the four directions by Gopuras whose height decreases towards the centre, where the main temple is marked by its position. Its presence is inconspicuous, its diminutive superstructure barely noticeable as it emerges from the flat roof of a covered court. With its many subservient buildings immersed in the air space and fenced off by repeated high walls and their Gopuras, the total South Indian temple-town covers the ground marked in the four directions by the sequence of the Gopuras of successive walls, within the outermost enclosing wall. The shrinkage of the superstructure of the centre, the diminution of the height of the main temple is a paradox of which the meaning is adjusted by relating it to the enclosure (paridhi, prākāra) and its architectural form, the hypaethral temple. Between the beginning and the end of this development lies the formation of the superstructure of the South Indian temple, a pyramid of many storeys each with its enclosing parapet of chapels and crowned by a small High Temple (Vimāna).⁵⁵

⁵³ This temple and also the rock cut Kailāsanātha Temple in Elura are Sāndhāra Prāsādas, the inner ambulatory intervening between the outer wall in which are 'embodied' the chapels, and the inner wall of the Garbhagrha.

⁵⁴ The Dharmarāja Ratha in Mamallapuram though but a small model of a temple, carved out of the rock, (total height 40') however provides a passage in each of the 3 storeys of its superstructure wide enough for walking around the central part of the monument (Fig. f).

⁵⁵ The whole development outlined above was that of the large temples only. The small shrines (alpa-prāsāda) in South India remained in their constituent parts the same as they are

THE HINDU TEMPLE

The devolution of the South Indian Prāsāda, the shrinkage of its height in comparison with the Gopuras, the gate towers of the surrounding walls, whose height increases with their distance from the temple in their centre, appears a paradoxical development, but it may be understood as a return to type. Few representations and no structural examples of this type are preserved. The representations are of an early age and from central and northern India, from Barhut and Mathurā. A high structure is seen there; it encloses and encases a small building which is the main temple. The central sanctuary surrounded by structures larger than itself shows here the principle of the Garbhagṛha extended to the building that holds it. The small central temple with the image in the Garbhagṛha is the Sanctum Sanctorum comparable in its position to the "Throne of Supreme Blessedness".⁵⁶

This vision is akin to that of the city of Brahman ('Chāndogya Upaniṣad', VIII. I. I), wherein is a small centre, a dwelling, in which is a small space.

carved in the Gaṅgāvatarāṇa relief in Mamallapuram (see note 34, Pt. VI) and similar also to temples like the Śiva temple at Enadi. The parapet of cells was not embodied in their form. The main Garbhagṛha below, and the shape of the High Temple above, were united through their proportionate measurement and sculptural elaboration.

II. THE CURVILINEAR SUPERSTRUCTURE (ŚIKHARA)

However manifold the varieties of the pyramidal superstructure proved to be, they do not attain in number, wealth and distinction, the range of the curvilinear Śikhara which belongs to the Hindu temple throughout four-fifths of India. The river Kistna (Kṛṣṇa) is generally taken as the southern boundary of its extent. Temples having curvilinear Śikharas however exist even south of the Kistna and as far as the Tungabhadra.⁵⁷ Amongst the several types and stages of their development, two shapes are fundamental. The one kind of Śikhara, (Fig. d), except for the inward curve of its sides does not differ in detail from the pyramidal type of the superstructure (type IA. 2) as represented in the Sūrya temple at Sūtrapada, for example. Its horizontal courses have generally the profile of cornice mouldings; Gavākṣa 'windows' are carved on them. In this type of Śikhara (Fig. d) as well as in the corresponding pyramidal superstructure, an Āmalaka, indispensable as crown of the whole superstructure (Fig. c), may also be placed at the four corners.⁵⁸ There they were seen supporting the topmost course or slab of the superstructure (Temple No. 10, Aihole; Fig. b). This may represent an early stage of the employment of the Āmalaka on the trunk of the superstructure. The Āmalakas are, however, repeated in most of the curvilinear Śikharas in regular intervals reinforcing the curved edge where they mark the Bhūmis, levels, or storeys.⁵⁹ Each Bhūmi has several strata, first only two (Fig. d), and subsequently an ever increasing number of horizontal layers (Pl. LXXI), mouldings and recesses, the mouldings opening their Gavākṣa 'windows' as carved symbols (Fig. d) in growing profusion until their rounded shapes are but the meshes of a patterned network which is cast over the Śikhara (Pl. LXXI, etc.).

On the earlier temples, from about the 6th century, the distinction between pyramidal and curvilinear superstructure of this type is one of degrees only. The sides bulge but little (Temple IX, etc., Aihole) or else, on the temples of another provincial variety in its later phases (Liṅgarāj Temple, Bhuvaneśvar, Orissa), the

⁵⁷ The curvilinear Śikhara, as illustrated in Figure d, is preserved with its Āmalaka intact, on two shrines at Mahākūṭa (ASI, Madras Photographs, 1938-39, Nos. 1744, 1746) and also on two shrines belonging to the Rāmaliṅgeśvara Temple at Kurnool (Satvel; 'South Indian Epigraphy', 1940-41, Photographs Nos. 1972-75; 1942-43, Nos. 2251-61); a number of temples having curvilinear Śikharas are in Alampur (Raichur); 'Annual Rep. Arch. Dept. H. E. H. The Nizam's Dominions', 1926-27, Pls. II-IV, X f. On some of the early Śikharas, the corner Āmalakas have their original rounded shape (relief of a Gupta Śikhara, Deogarh; ASI, U. P. Photographs, 1942-43; No. 467).

⁵⁸ The Āmalaka crown corresponds to the Svayamātrṇā stone on top of the fifth layer of the Vedic altar. The Āmalaka at the 4 corners has its Vedic analogy in the four naturally perforated stones placed in the 4 directions of the High Altar according to the teaching of the Kaṭhās ('Āpastamba Śrauta Sūtra', XIX, 12, 16).

Technically however the Āmalaka is not a holed, but a solid stone and serves to lock together the sloping walls of the superstructure.

⁵⁹ Cf. also type IB. I, the Mahābodhi temple.

Śikhara has almost perpendicular, straight sides which curve in towards the shoulder course only of this truncated superstructure.

From the beginning, the curvilinear Śikhara has one central projection in the shape of a broad offset, all along its height (Fig. d). Where this superstructure appears on top of the walls of the square Garbhagrha, the walls themselves are similarly buttressed (Pl. LXXI). The surfaces, in receding planes of the superstructure, are the vertical extensions of the theme of the perpendicular walls of the 'ground floor'. As one unit, the entire Prāsāda steps forth on the four sides; the central buttresses or offsets frequently even exceed the sides of the Śikhara in height and are extended above its shoulder-course (skandha) into the region of the neck (grīvā) below the Āmalaka (Pls. LXXI, XLIII; Fig. i, p. 212).

The buttresses have their beginning at the foot of the wall of the temple, including the socle, the Adhiṣṭhāna. The broad projection of the central buttress makes the ground plan of the Prāsāda cruciform (see ground plans, Pt. VII). This is also the form of the central part of the Gārhapatya hearth where it results from the shape itself of the bricks (plan in Part VII). On the perpendicular walls of the temple, within the buttresses, in their niches or 'massive doors' (ghanadvāra), are placed as images the main aspects of the divinity in the temple (Pls. LXXI, XLIII). Thus it appears to have stepped from within the Garbhagrha, through the massive walls of the temple and its 'solid doors' for an aspect of the deity has no physical body but it is given form and is bodied forth across the wall and itself is the door, by which the devotee in his heart and mind approaches the central divinity. It is made manifest on the outside of the temple; with this exteriorisation, the Prāsāda wall itself, as it were, keeps pace; in the middle of its surface it steps forth in the shape of a buttress, a symbol of progressive manifestation in terms of architecture. In the course of time the buttresses are increased in number and in depth. Their structural significance is small, no stresses have to be counteracted for the whole monument, the Prāsāda, is built in horizontal courses which rest on their support in the vertical. They do not exert any lateral thrust. Trabeation and corbelling are employed in the Prāsāda and the Maṇḍapas for spanning spaces and constructing domes. The buttresses could be dispensed with structurally but they are indispensably part of the form of the Prāsāda, the monument of manifestation of the Supreme Principle. From the centre of the dark Garbhagrha, it shows forth in the architectural theme and in the images on the walls of the temple. It leads from the bottom of the temple to its crown, the Āmalaka (Pl. XLIII).

The buttresses do not form part of the flat roofed dolmen temple. They can be thought of as having originated in brick structures corresponding to the augmentation of a central area, by adding bricks in the four directions as in the piling of Vedic altars (Figs. in Part VII), not only but also in pillared buildings whose halls are made spacious by an analogous arrangement of the pillars. When the buttresses make their appearance on the otherwise plain walls of the Garbhagrha, its roof is no longer flat but carries the superstructure, the Śikhara (Deogarh, etc.).

The indispensable buttresses of the temple with the curvilinear Śikhara belong to its total form; they have their origin neither in the stone slabs of the dolmen nor in the Tabernacle of bended branches. Brick laying, as in the Vedic altar, might have facilitated their employment and pillared halls with their regular inter-

columniations might also have preceded them. Such as they are they convey directly the meaning of the Prāsāda and are part of its monumental form.

The other shape of the Śikhara has its perfect appearance in temples such as those in Khajūraho (Pls. I, IV; Fig. i). It surges towards the apex; other smaller Śikharas cling to it in a massed competition of ascent. Although each of them has its edges marked by Bhūmis of many strata and by Āmalakas, these horizontal elements, like the nodules of the stem of a plant, do not break its rising lines. Their curves belong to forms of vegetation, the ribs of the large leaves of Banana plants, of palm trees or bamboo rods fixed in the corners of a square drawn on the ground and bent towards a central point; with their curves the stone built Śikharas of the Khajūraho temples arise and reiterate in their complex organisation the perennial meaning of the Tabernacle of the forest. It served and still serves the performance of worship (pūjā) and vows (vrata). When these Pūjās and Vratas are completed, the leaves and branches which had formed the Tabernacle, having served their purpose, are thrown away, whereas the form of these temporary and humble structures was clothed in brick and stone and raised above the Garbhagṛha, in the innumerable Śikharas known to exist from the Gupta age and which to this day compete towards the Highest Point.

The Tabernacle of leaves, bamboo or branches is the prototype of the curvilinear Śikhara. The arch of vegetation, the arch of Nature surmounts and encloses the seat of God. In temple chariots with a framework of bamboo, as much as in the temples themselves, it is this 'Form of Nature', which remains one of the primeval and sempiternal forms of sacred architecture in India. It is the most sacred of all the forms of the superstructure, destined for the Prāsāda only. It is never placed as superstructure on any Maṇḍapa or any accessory building of the temple proper. There the pyramidal types are accommodated, and at times assimilated to its curves, without however attaining to their unbroken ascent (Pl. I).

The construction of the curvilinear Śikhara, by means of a division in geometrical progression—by four fold division (caturguṇa sūtra) in this instance—is given in the 'Hayaśīrṣapañcarātra', XIII. 324 f. and 'Agnipurāṇa', XLII. 15-17. This particular method which is indicated here, underlies the process by which the batter of the curved outline of this type of the Śikhara is determined. The 'Samarāṅgaṇasūtradhāra' gives further information and the 'Bṛhacchilpaśāstra', with a recent commentary in Gujarati, is partly even more explicit.

The 'Agnipurāṇa' passage speaks only of the four Sūtras, which are to be separately drawn—from the base of the Śikhara up to the other end, the Skandha,—for the 'purpose of the Śikhara' (śikhārārthaṃ hi sūtrāni catvāri vinipātayet). These vertical parallels are intersected at certain regular intervals by horizontals (Figs. on p. 209 f), of which only one is given in the 'Agnipurāṇa' at the height where the Śukanāsā is to end. There a lion's figure should be carved. In the 'Agnipurāṇa', its position marks the middle of the Śikhara. A lion's figure, carved in the round juts out from above the 'Śukanāsā' of the temples in Orissa. The later texts make it clear that the shoulder course of the Śikhara is generally assigned 6 parts in width, the base of the Śikhara measuring 10 such parts ('Samarāṅgaṇasūtradhāra', LVII. 664 b; 'Bṛhacchilpaśāstra', III. 81). The height of the trunk of the Śikhara being given it should be divided by geometrical progression into a certain number of parts, three, four, five

or six according to the 'Samarāṅgaṇasūtradhāra'.⁶⁰ A line parallel to the height is drawn from one end of the Skand'ia to the base of the Śikhara and one more parallel from the end of the base of the Śikhara. The width of this rectangle is 2 parts and its height is equal to that of the trunk of the Śikhara (Figs. on pp. 209 f). Into as many parts as the height is to be divided—in a geometrical progression—into so many parts also is the narrow side of the rectangle divided. The texts always speak of 'tri-guṇa, catur-guṇa', etc., 'sūtra'. This, no doubt, implies that the division of the height should be in a geometrical progression (guṇa saṅkalita).⁶¹

From these indications, repeated in the description of practically every single variety of the Śikhara, (in Chapters LVI and LVII of S.S.) it appears that the curve of the Śikhara is given by connecting the points of intersection of these lines.

The total height has to be divided, for example, in geometrical progression into six parts (ṣaḍguṇa sūtra). The narrow side of the rectangle however has to be divided into six equal parts of its own. The vertical parallels drawn through these points are equidistant. They intersect the horizontal parallels which are drawn in a geometrical progression. The curve is drawn through their points of intersection (Fig. on p. 210).

The method of drawing the curve was common knowledge and did not require an explanation. A different curve resulted according to the number of divisions. It sufficed if this number was stated; by controlling the lines according to a well known method,⁶² the batter of the superstructure had to be made.

⁶⁰ S.S. LVI. 137: "Caturguṇaiḥ prthaksūtraiḥ padmakoṣaṁ samālikhet"; LVI. 275: "Prthaksūtraistriguṇitair venukoṣaṁ samālikhet"; LVII. 817: "Siṁnaḥ pañcaguṇaṁ sūtraṁ rekhāntaṁ tatra vartayet". LVII. 674 prescribes "ṣaḍguṇa sūtra", etc.—These passages indicate that lines have to be drawn severally from three times to six times, dividing the height of the trunk of the Śikhara in a geometrical progression by three, four, five or six, while another set of lines of corresponding number and at equal distances is drawn parallel to the height, within the rectangle described above. The terms 'Venukoṣa', the "sheath of the reed", 'Siṁa', the boundary or width of the Prāsāda, are explained in Part VII.

The curve is drawn through points of intersection of the horizontal and vertical lines.

In drawing the curves of Śikharas as Figs. on pp. 209-10 show, based on an interpretation of the term 'guṇa' in the sense of 'guṇa saṅkalita' or geometrical progression, the writer has had this view confirmed by Mr. E. C. Gentry, A.R.I.B.A., New Delhi.

⁶¹ The illustrator of the 'Bṛhacchilpāśāstra', III. 78-94, attempts a division of the height into equal parts, with the result that the curvilinear outlines of the many varieties of Śikharas are identical in his constructions. The curves moreover, are not drawn through the points of intersection.

The figures denoting the batter in 'Canons of Orissan Architecture', p. 111 f, and the accompanying drawing of the curvature of the 'gaṇḍi' do not appear to illustrate a mathematical rule. Cf. however the term "Rekhaguṇāghāṭa" (pp. 114-5).

The methods practised by the ancients can be ascertained only by measuring the batter of the extant Śikharas and correlating these measurements with the formulæ given in the Vāstu-śāstras.

Practising craftsmen (Dāmodar Mahārāja) in Bhuvaneśvar determine the curve of the 'gaṇḍi', i.e. the trunk of the curvilinear Śikhara, "according to its beauty". They know no formula for its batter; they take however the width of the shoulder course as measuring $\frac{3}{4}$ of the base (and not $\frac{3}{5}$, see p. 207); and the width of the 'gala' as $\frac{1}{2}$ of the Mūla-sūtra; the height of the temple being twice, etc. its width (cf. Part VII), the perpendicular walls are assigned a height which is $\frac{3}{4}$ th of the width.

⁶² "Rekhāvaśena kartavyāḥ praveśāḥ" (S.S. LXV. 18).

THE SUPERSTRUCTURE

The Prāsādas as described in the 'Samarāṅgaṇasūtradhāra', Chapters LVII, etc., with their curvilinear superstructures (Śikhara) are the most particularly Indian amongst the monumental shapes of the temple. While cube, prism and pyramid belong to sacred architecture not only in India, the monumental shape of

Curve of Śikhara drawn by means of 'triguna sūtra', the end of the rectangle being divided by three and the side by geometrical progression of three.

the 'Tabernacle' originally of branches, etc., curving towards one point, is the pre-eminent shape of the Hindu temple. It formed the nucleus of many developments, and has thrown forth multiple proliferations of its shape. Rich in possi-

The word 'Vāśa' which means 'power' might be taken to refer to "the lines which constitute the sides of rectangles bearing a square-root relationship with their ends." Dynamic symmetry however does not seem to be implied in the indications quoted in note 60. See also the proportions and measures given in Part VII. Scarcely any accurate measurements have as yet been made of extant Śikharas.

bilities they have been elaborated and massed around the central dominant theme, accompanying its direction towards the highest point.

The curve of the Śikhara drawn by means of 'saḍguṇa sūtra' (division and geometrical progression by six) is more attenuated than those drawn by 3, 4 or 5 fold division.

THE MAIN VARIETIES OF THE CURVILINEAR SUPERSTRUCTURE

IIA. THE CLUSTER OF ŚIKHARAS

The extant temples having curvilinear Śikharas are distinguished by the following features : The plan appears cruciform (see drawings in Part VII); this is the result of the central major projection of each side, generally called Bhadra, being flanked by more shallow lateral offsets, called Ratha. If the temple has an ambulatory the Bhadras appear like transepts in the plan ; the Talacchanda of the

Prāsāda is accentuated in the 4 directions, in which the temple seems to step forth from the straight inner walls of the Garbhagrha. The square of the Garbhagrha is transmuted into the cross of the Prāsāda; the static centre of the temple is ensconced by its dynamically laid out perimeter. The steps in the plan correspond to the buttresses or planes of the perpendicular wall of the Prāsāda. They have no structural purpose and are the monumental form of the progression from the centre; they are carried up the Śikhara, and terminate at the shoulder-course (skandha); in certain temples as already pointed out, the main offsets of the Śikhara even exceed the Skandha and point towards the Āmalaka (Pls. XLIII, XLV; Fig. i).⁶³ Above the Skandha, the Āmalaka, held aloft by the round neck, supports the finial.

The Śikhara has two main shapes. The one, IIA, consists of a central curvilinear Śikhara surrounded by clusters of similar Śikharas (Pls. I. IV; Fig. i). These are formed by one or several half Śikharas or Śṛṅgas leaning against the 'chest' (uras) of the main Śikhara and of each successive Uromañjarī. At the corners, narrow and high quarter-Śikharas fill and round off the recesses between the Uromañjaris and the main Śikhara (mūla-Śikhara or Mañjarī), while smaller part or three-quarter Śṛṅgas are grouped in the lower courses of the Śikhara each in continuation of a buttress or offset of the perpendicular wall of the Prāsāda. The many variations of the theme of the Śikhara cluster are brought about by the number of Uromañjaris of the Śikhara, the number of Rathas or offsets of the perpendicular wall and the number of horizontal rows in which are set the miniature Śikharas called Tilaka (sesamum seed) at the base of the main Śikhara, the Mūlamañjarī. These factors depend on the specific proportions of the particular type of temple and also on its height and the curvature of the superstructure. All the subsidiary Śikharas and other shapes are always subordinated to the main and dominant central Mūlamañjarī.

Type IIA has the multiples of its own form set forth in the 4 directions; they ascend moreover from the corners, and each time to the same height as the respective Uromañjaris; they are accompanied furthermore in this massed competition towards the apex, by lesser replicas at the base, attaining to smaller fractions of the height while they reinforce on their own, lower levels the urgency of the ascent. Each of these multiple replicas has a 'neck' (grīvā), Āmalaka and finial of its own; while these terminate the single forms, they punctuate the striving of the entire mass of the superstructure towards the final point which lies beyond its trunk, whatever its height. The single Śṛṅgas, as a rule, are spaced with increasing distances towards the top whereas the single Bhūmis or horizontal courses of which each Śṛṅga is composed, decrease in height towards the summit of the Śikhara. A counter-play of proportions results from this double progression, contracting on the upper register of the wall surfaces of each Śṛṅga and expanding with reference to the superstructure as a whole. Its tension makes even more ostensibly coherent the substantiality of the monument whose texture thus is seen not as that of the stone or the bricks but appears to be composed of the acceleration and the halting of the ascent.

⁶³ In this final and 'excessive' ascent the buttress quits the body of the building; while it is non-structural throughout its end has the appearance, though not the function, of a flying buttress (Pls. LXXI, XLIII).

THE HINDU TEMPLE

Temples of this type are represented most perfectly in central India, especially in Khajuraho; in northern Gujarat, and also in Rajputana; the Rāja-Rānī temple in Bhuvaneśvar, Orissa, belongs to this type according to the style of that country.

Fig. i. KANDARIYA TEMPLE, KHAJURAHU.
From B. L. Dhama, 'A Guide to Khajuraho', Pl. IV.

The pillared halls which lead to, and surround, the Garbhagriha occupy the ground floor (samsthāna) only. The vast superstructure is invisible from inside, where halls and Garbhagriha are closed by trabeate domes of varying height. The main dome is over the centre of the main

In this zone across the width of northern India, however, none of the extant temples of this type is earlier than the tenth century. This does not imply the relative lateness of the type; on the contrary, earlier less evolved temples of this type are no longer in existence.⁶⁵ There ought to be Śikharas with but one set of Uromañjaris instead of the usual two or four sets; the centre, the Mūlamañjarī, if imagined without the many flanking Śrīgas and Tilakas, corresponds to a complete curvilinear Śikhara in the shape in which it has not only the widest distribution but also the longest history (Type II[B]). Although relatively earlier Śikharas of this type (II[B]) are preserved—from c. the sixth century, type IIA of which no earlier representatives than those of the tenth century exist, is the more pure of the two embodying in the main but one prototypal shape which is that of the Tabernacle of bent branches. This shape was amplified by throwing forth multiples from its curvilinear walls, clinging to them like the petals of a bud about

hall (Mahāmaṇḍapa). The Garbhagrha, though raised high above the level of the Maṇḍapa, has its dome on a lower level than that of the central dome of the Maṇḍapa.

The Liṅga in the centre of the Garbhagrha is straight below the finial and the middle of the Grīvā, if the shaft of the latter is imagined to traverse the whole Prāsāda.

The interior of the superstructure is not meant to be seen; cf. note 65.

Seen from the outside, the superstructure three times rises and falls to an ever higher level; each of its peaks is above the centre of a hall; the long drawn out descent of the superstructure above the main hall is met by the steep vertical of the Sukanāsā, the antefix of the front of the Śikhara of the Prāsāda. The Sukanāsā is above the Antarāla or porch of the Garbhagrha (re. Sukanāsā, see Part VII).

The steep slope of the back of the Prāsāda (W) is beset with Uromañjaris. Their Kalaśas, and the high ends of the middle buttress of each, punctuate its curves.

The perpendicular walls of the temple open up between rooflets and seats. The latter with their sloped backs are shown in the sectional drawing; the seats rest on 'pillars' which also traverse them.

The temple rises from a high socle (adhiṣṭhāna) and has steps in the East. Below the solid Adhiṣṭhāna is the broad terrace which supports the temples of Kandariya, Mahādeva and Jagadambā Devī (Pl. I).

⁶⁴ Jain Temple in Osian; Someśvara Temple in Kiradu, 12th century, etc. The Mūlamañjarī or main Śikhara exceeds by 3/10 parts of the height of the Śikhara, the portion (7/10 parts of the height of the Śikhara) occupied by the Uromañjaris ('Bṛhacchilpaśāstra', III. 80).

⁶⁵ The 'Four sided' temple of the 'Bṛhat Samhitā', LV, having 5 Aṇḍas appears to have had 4 Uromañjaris massed around its Mūlamañjarī (see Part VII). The Sukanāsā of Type IIA, as a rule, has the outline of a triangular pediment and not of a Gavākṣa. It is however filled by a network (jāla) of Gavākṣa tracery; Tilakas or Kūṭas in many cases add their small but solid shapes to this particular Sukanāsā (Pls. I; LXXI). The topmost Gavākṣa, forming the apex of this pediment is an actual small window opening in the Śikhara of the Kandariya temple. The interior of this Śikhara (Fig. 1) is divided into internal chambers bounded by large piers and having for their floor and ceiling transverse stone beams. The single, dark, room like, corbelled cavities may be entered by an invisible opening above the Antarabhitti, the inner wall of the Prāsāda (see Part VII), whence the stalagmitic interior of the superstructure may be traversed in all directions. It served however no part of the cult and was not meant to be seen. It is built on the principle of the horizontal tie-plate.

In the temples of Orissa, there are four such horizontal courses only, those of the ceiling (garbha muda) and shoulder-course (ratna muda); between these are the Balimuda and Lakhi muda; these are invisible from outside. Below the Ratnamuda, a small rectangular window opening admits some air and light into the interior of the 'gaṇḍī', the trunk of the Śikhara.

to open. Far from imitating forms of nature, such as volutes, stems, foliage or flowers, it was made in conformity with the energies active in producing those forms. Repeated in proportionate reductions, the Śṛṅgas, together with the symbols carved on them, integrally belong to the whole Śikhara and with it lead towards the highest point of the temple. The Tabernacle of bamboo, leaves or bended branches translated into brick or stone was elaborated and amplified logically in accordance with the energies of form inherent in its pristine shape.

II[B]. THE ŚIKHARA ENMESHED IN GAVĀKSAS

The curvilinear Śikhara II[B] described already in an earlier connection (Fig. d) has been seen on the temples of the Kanarese country, of the seventh century and prior to it. The same type prevails in Orissa from the eighth century and is also frequent in the Deccan⁶⁶, in Rajputana (Pl. LXXI), Central India and as far north as the Western Himalayas. Its surfaces, in continuation of the theme of the perpendicular walls of the Prāsāda, are made up in every instance of the central buttress and those at the corner; between these may be added two or four intermediate buttresses. The several buttresses appear as graded planes on the body of the Śikhara; they function each as a pattern unit. The theme of the corner buttresses of the Śikhara remains one and the same throughout the centuries and in all the countries. It can always be recognised as consisting of horizontal units, called Bhūmi, each of which represents the trunk of a miniature Śikhara with its Āmalaka. Such a miniature Śikhara may consist of one or two courses only below its Āmalaka as in Aihole (Fig. d), or it may comprise six courses, as on the Liṅgarāja temple in Bhuvaneśvar. Each course represents the eaves of a roof. These miniature Śikharas are strung together to form the vertically extended corner-buttress, the edge of the total⁶⁷ Śikhara; according to the shape of the total Śikhara and the height at which a small Śikhara is placed, it will be curvilinear or it will appear straight (Pl. LXXI). The horizontal courses give solidity to the soaring movement of the superstructure.

The inner buttresses of each side show, according to the chronological sequence of the temples the single strata or cornices with their 'attic windows' either as separate motives or as increasingly connected amongst themselves by the 'gavākṣas' or attic windows forming a tracery which is cast like a net (jāla) over them, at first veiling two or three such strata only and finally covering the entire length of the Śikhara offset. The body of the Śikhara enmeshed in it, clasped as by a creeper (latā), shows by its lateral indentations only the strata themselves, the original roof-edges. Such 'overgrown' buttresses are therefore called Latinā, in Vāstu-śāstra. They are one with the tracery of the 'creeper', the Latā, that covers each of them. Its unit always remains the curvilinear Gavākṣa.⁶⁸

⁶⁶ At Anjaneri near Nasik; Cousens, op. cit. Pl. LVIII (Temple No. 7).

⁶⁷ It is called Koṇaka-pāga in Orissa.

⁶⁸ Coomaraswamy, 'Early Indian Architecture: III', in 'Eastern Art', vol. III, Figs. 57-78, shows various uses of the Gavākṣa motif and its repetition, sectioning and reductions in various

This, the most widely diffused type of the curvilinear Śikhara, is an amalgam of two constituent shapes. The one, it has been shown already, was the nucleus of the type called IIA. There it formed not only the root-Śikhara but also the model of all the multiple and lateral issues of this type. The Tabernacle formed of branches curving towards the point in which they are gathered is its perennial prototype.

The other constituent of Śikhara II[B] is the straight trunk of the superstructure in its pyramidal forms such as has been discussed in different stages and types (Figs. a-c). Both the curvilinear Śikhara as also the pyramidal superstructure were built not only in the earlier centuries at one and the same place, in Mahākūṭa and Aihole or in Satvel, Kurnool, in the Deccan, but—by the side of each other—also in the Western Himalayas, in Dvarahat, Almora.⁶⁹

The close connection of type II[B] with IA.2 has been shown already. The curvilinear form of this type II[B] however is not in any way derived from the pyramidal shape.⁷⁰ It presupposes a curvilinear prototype, the Tabernacle of leaves, bamboo or branches. The Bhūmis—indicated at the corners along the edge of the Śikhara—do not belong to the Tabernacle prototype.

The curvilinear Śikhara II[B], its edges beset with several Bhūmis, each marked by an Āmalaka crowning the horizontal strata, and itself a miniature Śikhara, is a complex shape; in it the general shape of the Tabernacle comprises parts such as contributed also to the pyramidal trunk of type IA. These are the strata whose contours were assimilated to roof shapes of current types of buildings. Together with their windows they were combined and subordinated to the Āmalaka which gathers and crowns their shapes into one unit, one miniature Śikhara; strung together they are as many as the Prāsāda has Bhūmis in its superstructure. The principle of repetition is seen here applied in the vertical; garlands of closely set miniature Śikharas rise on the arched edges of the Śikhara, type II[B].

This theme had also become incorporated in the Śikhara type IIA; there, however the web of Gavākṣas is subdued in its effect and altogether 'overshadowed' by the powerful proliferations of the Uromañjaris on the sides of the major Śikharas where they form slabs and slices of masonry, compact petal shapes with minor volumes of miniature Śikharas, etc., filling the corners.

Proliferation in the four or eight directions of space and on various levels is the generative principle of the Śikhara IIA. Superimposition of repeated units,

Gavākṣa patterns; cf. Part VIII. Pl. XLVI, etc.—Gavākṣa defined as Gonetra or "Bull's eye", designates also the unit of the pattern of the Jālaka or perforated screen, etc., on South Indian temples. Six varieties are described in the 'Śilparatna', XXIV. 9-10; 'Kāśyapaśilpa', XI.

The Orissan variety of the Rekhā temple of the "Nāgara" class (see Part VII) would thus most perfectly be a Latinā temple. This particular variety is not confined to Orissa only, but is also represented in Mayurbhañj, Bengal and Assam in local versions. The 'Bṛhacchilpaśāstra' (Part III, ch. XI. 503), more concise than the 'Samarāṅgaṇasūtradhāra' in this case, defines Latinā as 'Nāgara with one Śṛṅga' and in Part III. ch. V. 71, assigns Latinā to Gauḍa and Kāmarūpa, i.e. to Bengal, and Assam, where this variety of the Rekhā temple had found general acceptance.

⁶⁹ ASIAR, 1924-25, Pl. III. Temples of the Maniyan group.

⁷⁰ See however, Coomaraswamy, HIIA, p. 83.

No amount of the compression of miniature straight shapes can produce a curve of the total shape.

however, as especially seen in II[B] is not particular to the curvilinear Śikhara only. Stūpa shapes, for example, were similarly super-imposed in towering structures.⁷¹ The vertical series of miniature Śikharas, indicative of Bhūmis or levels, is subsumed in type II[B] in the total Śikhara or Tabernacle. The series of small corner Śikharas is not only completely integrated in its curvilinear edge; they are proportionately part of its height, which they build up in an arithmetical progression, most frequently (S.S. LXIII).

The edge of the Tabernacle in extant stone temple II[B] is not however always beset with the symbolic-architectural detail of miniature Śikharas forming the Bhūmis. In some of the subsidiary shrines around the Liṅgarāja Temple in Bhuvaneśvar, Orissa, the Śikhara with its offsets is otherwise without any complexities; in some of the later West Himālayan temples the one central buttress is flanked by lateral walls as plain as it is itself but for some widely spaced courses of narrow Āmalaka shapes which demarcate the Bhūmis. Such retrogressions in varying degrees towards the original shape of the Tabernacle, prove the leading importance of its total curvilinear shape and the accessory role filled by the various smaller devices all of which are either its replicas on a smaller scale or of parts of it.

The temples in which the ascent is continued in one theme from the walls of the Prāsāda to the shoulder course of the Śikhara are called *Latīnā* in *Vāstu Śāstra*. The *Latās* or single offsets of the Śikhara each with its web of 'sunray windows' or *Gavākṣas* carry the vertical movement steadily upwards. Its urge and also its assurance rest on the curved walls of the Śikhara. Between the several offsets are recessed chases (*jalāntara*); their shadows outline the verticality of this Śikhara while they also add tone and enliven the many horizontal mouldings which are carried in tiers across the facets and the recessed chases. Between these horizontal mouldings run narrow but deep, horizontal bands of shadows. With their dark lines they clasp the entire volume of the Śikhara. Over it is cast the trellis of point like openings of the *Gavākṣas*; light and shade thus become part of the texture of this Śikhara.

This form of the curvilinear Śikhara has been particularly perfected in Orissa;⁷² the coherence of its monumental shape is enriched by carvings; nowhere else in India are the walls of the temple as intimately connected with their sculptures. As the offsets project one from the other so also do their outermost planes show their carved patterns in more than one surface of interlaced scrolls; these fill the panels that form the background of the images of the gods. The temple here is a work of monumental sculpture of which the single carvings form the intricate

⁷¹ Coomaraswamy, *ib.*, Pl. XIX. Fig. 69A.

The convex curve of the Śikhara known from the sixth century onwards may be contrasted with the concave outline of South Indian gate towers or *Gopuras* of about 1700 A.D. The latter outline may be seen against those of the roofs of South Indian houses, especially on the Malabar Coast. Their bamboo frame is bent concavely.

⁷² The various shapes which contributed to the Orissan temples have their models carved on the walls of the Liṅgarāja and Brahmeśvara temples specially and also on the Citragupteśvara and other of the later temples in Orissa. The stringing of *Śrīṅgas* on some of the 'lesser' *Latās* or 'Pāgas', as they are called there (*anuratha pāga*), of the temple is a sign of an assimilation by this school of sequences of form which belong to the architecture of central and western India.

surface. They are contiguous and unbroken by large openings such as those of windows, etc. These, where present in Maṇḍapas, are screened with sculptured compositions.,

The closed volume of an Orissan temple consists of the Prāsāda and its Maṇḍapa; the former is the Rekhā or Bara Deul and the latter is the Piṛhā Deul; its superstructure is pyramidal, it represents type IA. In its fully evolved shape it is crowned by an Āmalaka above a Ghantā (bell-shape). The two shapes of the superstructure, the curvilinear Śikhara II[B] and the pyramidal Śikhara IA here conjointly, each by the side of the other, form the perfect shape of the Orissan temple, the lower Piṛhā Deul being subordinated to the higher Bara Deul in proportionate measurement of which the width of the Prāsāda is the module.⁷³ The balance of these two contrasted superstructures, a closely knit unity of Prāsāda or Bara Deul and Maṇḍapa or Piṛhā Deul, is peculiar to Orissa. In the other provinces the superstructures of the Maṇḍapas prepare and defer the climax of the Śikhara of the Prāsāda (Pl. I).

Multiform and lending itself to the widest variations however is the clustered Śikhara (IIA). Its Uromañjaris widen the base of the total superstructure. It is thus specially suitable for Sāndhāra Prāsādas—having an inner ambulatory and projecting Bhadras or buttresses in the middle of the sides (Figs. in Part VII). Bhadra, Śālā, and in addition also Catuṣkikā, an open pillared balcony, can thus be added one upon the other, leading to a further progression and extension of the cruciform plan; while in the vertical direction their digression is gathered up by the Uromañjaris as they lean against the central body of the Mūlamañjarī. The perpendicular walls are frequently broken by balconied openings in the cardinal directions and deep shadows cut into the body of the temple, while flat surfaces, instead of the mellow graded shades of the Orissan scroll work are a frequent accompaniment and background to the images on these temples.⁷⁴ Altogether these temples are greater in the tension of their units, different in size and power and competing in the same direction; some acquire their full stature, however small, at a low level, while the high road along the central face of the innermost Śikhara is punctuated by the simultaneous rising of several forms of varied surge, to different heights.

⁷³ Bara Deul and Piṛhā Deul retain the completeness of their shapes, the former is without the connecting projection of the Sukanāsā; it is outlined against the sky in the integrity of its ascending curve, and is separated from the sloping outline of the Piṛhā Deul by a deep incision. In it the shapes of lions (siṃha) jump forth, the one from the 'Rekhā', the other from the Piṛhā Deul, they form the sculptural link between Bara Deul and Piṛhā Deul.

In Rajputana, Osian, etc. the Śikhara is closely related to the Orissa type. The logic of form of the entire temple however is absent. There, open pillared halls are an airy prelude but detract from the grandeur of the closed mass of an Orissan temple, however small its actual dimensions may be.

In plan, the Orissan temples are more closely related to the scheme 'Prāsāda Kṣitibhūṣaṇa' (Part VII) than to the more richly differentiated shapes.

⁷⁴ The architectural contrast of dark expanses of shadow and flat wall surfaces in the light has its equivalent in paintings whose quality lies in the juxtaposition of coloured surfaces (cf. 'A Painted Ceiling', JISOA, vol. VII, Pl. XVIII, at Madanpur, in Central India; and the Western school of Indian painting).

Here too, the Maṇḍapa or Mandapas, each with a superstructure of its own, are fused with the Prāsāda in one plan; their separate superstructures indicating their number and original separateness (Fig. i, p. 212). They are graded in their slow ascent towards the Mūlamanjari of the Prāsāda. The superstructures of the Maṇḍapas, though they also as in Orissa belong to the pyramidal type (IA) are assimilated (Fig. i) to the curves of the Śikhara of the Prāsāda.⁷⁵

IIC. THE COMPOSITE ŚIKHARA

Composed of elements of both the 'overspun' (IIB) and the 'clustered' (IIA) varieties is a third (IIC) type of the Śikhara (Pl. XLIII). Its central offset is carried on in continuation of the buttress of the perpendicular wall; the curve of this projection, covered with the web of ray-windows (gavākṣa), springs from the base of the Śukanāsā. Kept in shape by these offsets on its four sides, the breadth of the segments of this Śikhara is set with horizontal rows of miniature Śikharas alternating with cubical 'Kūṭas'; these demarcate the storeys of this least ingenuous, and composite, form of the curvilinear Śikhara (Pl. XLV). It belongs to central India and the Deccan; there however the segments frequently are straight rather than curved faces and the four buttresses appear flung upwards like high, independent arches.⁷⁶ On the central Indian temples however with the uniformly curved Śikhara, the horizontal rows of Śṛṅgas and Kūṭas, far from producing a storeyed effect, appear as so many gigantic beaded garlands thrown up towards the neck (grīvā) of the Śikhara. The shadows in the vertical chases keep the single rows more deeply apart than the half shadows lingering over the slightly receding Kūṭas which alternate with the shapes rounded forth in broad light.

The straightening of the curve of the Śikhara, in the Deccan temples, is an assimilation of the Śikhara to the preference in the more southern parts of India for the pyramidal shape, which is the leading shape of a South Indian temple. This is not only a special feature of the 'composite' Śikhara (IIC) just described but also of the Śikhara (IIB) in the Deccan and can best be seen in the Pañcāyatana temple of Gondeśvara at Siñnar.⁷⁷

The third or 'composite' main variety of the curvilinear superstructure (IIC) is neither overspun by the web of Gavākṣas (IIB) nor is it shaped by a central

⁷⁵ To the Gujarat variety of this type of temple are added a Gūḍha and Sabhā Maṇḍapa, the former closed, as the name implies and one in plan with the Prāsāda proper; in front of it the Sabhā Maṇḍapa is an open pillared hall which, as in the Sūrya temple at Modhera, is a separate structure.

⁷⁶ Cousens, 'Mediaeval Temples of the Dakhan' op. cit. Plates, passim. Essentially however there is no difference in type between a temple like the Nilakanṭheśvara at Udayapur of the 11th century (Gwalior; Pl. XLIII) and the temple at Jhodga, Nasik (Cousens, ib. Pl. LIII), although in plan the Udayapur temple is stellate, of the 'Bhūmija' variety (S.S. LXV), its buttresses and vertical rows of Śṛṅgas being placed on edge, and not parallel with the main buttresses. Kūṭas flank also the central Latā, in Jhodga, a peculiarity due to its more 'southern' geographical position.

⁷⁷ Cousens, ib. Pls. XLIII-XLIV.

impulse and its proliferating activity (IIA). While it combines elements of both it loses the cogency of either form. In principle, though not in quantity, type II[B] is its more powerful component.

Highly flung central offsets overshoot the body of the Śikhara and reach up to the Āmalaka. They terminate as a kind of flying buttresses, disembodied and carrying no weight. On some temples, especially in the Deccan,⁷⁸ they secede from the body of the Śikhara not only at the top; the buttresses, in the four directions, project from the body of the Śikhara like gigantic ribs witnessing a process of disintegrating form; their curved shapes are reminiscent of the bended branches of the Tabernacle.

⁷⁸ Ib. Pls. LXVIII, LXX, XCII.

FUNCTION AND FORM OF THE SUPERSTRUCTURE

The Tabernacle of the jungle was placed on the dolmen, or also embraced while surmounting it. The dolmen had been raised on a platform or altar. These forms of sacred architecture are conjoined in the vertical direction; their indissoluble sum total is the Vimāna in its most typical Indian form.

The shapes of sacred architecture absorbed by the superstructure itself or subsumed to it are many. With them the image of the Mountain was given an indefinite number of variations. The purpose of the superstructure is always one and the same. It is to lead from a broad base to a single point where all lines converge. In it are gathered the multifarious movements, the figures and symbols which are their carriers, in the successive strata of the ascending pyramidal or curvilinear form of the superstructure. Integrated in its body they partake, each in its proper place, in the ascent which reduces their numbers and leads their diversity to the unity of the point.

An exchange of forms within a community of symbols went on through the countries and centuries; an ever more explicit and detailed exposition was given to the meaning of the Prāsāda; increasing coalescence of the several symbolic shapes on each of the types safeguarded its monumental unity. The intricate carvings all over the surface of the later temples do not distract the attention from their one and only purpose (Pls. I, XLIII, LXXI, etc.). In the strong light of the Indian day the profusion of plastic detail is absorbed into the texture of the monument. In its wealth its form is alive; it impregnates the carvings. In the most elaborate versions and their many combinations is the integrity of the original forms.

They had been assembled from diverse origins: superposed slabs and various types of roofs whose more mellow and suggestive shapes the vertical edges of the former assumed; and also actual roofs arrayed in similar stratification. This latter type, as in Gop, Kathiawar, and in Kashmir, however did not lend itself to great development in stone or brick buildings, due to the meagreness, as a plastic form of the pent roof of laminated boards.

Slabs in receding tiers are placed on the flat roof of the temples of village gods in the Tamil country and on Śiva shrines in the Himālayas. They help to hold the supernatural presence on the spot and correspond in this respect to the Sannirodhinī mudrā, the ritual hand gesture by which the presence of divinity is restrained and held at the place of worship, in the image in which it has its seat at that time. The slabs produced the trunk of a pyramid, stepped and gradually contracting into one steep ascent.⁷⁹

⁷⁹ With this have to be contrasted the layers of increasingly broad beams or slabs supported on posts, etc. and placed in several strata above a sanctuary: cf. the Bodhi-tree temple, as represented in a relief from Mathurā, 2nd century B.C. (Coomaraswamy, HIIA, Fig. 70) and the particular shape of capitals of Buddhist pillars, in which an Amalaka forms the most important part (Part VIII).

Richer in motif than this type (IA), of the pyramidal superstructure, is the other (IB) in which a storeyed building, the centre of a hypaethral sanctuary on each of its levels, is crowned by a domed High Temple and raised as a whole on the walls of the Garbhagrha.

As humble in its origin as is the series of slabs, whatever they originally might have consisted of, stone, or layers of bricks or less likely wooden planks, attaining height in the shape of a pyramid (IA),—is the curvilinear prototype of the Śikhara (II). The Tabernacle in the forest is one of the primeval forms of sacred architecture in India, as full of meaning in its curves as is the arch made of branches described in the “Āpastamba Śrauta Sūtra” under which, as under the rays of the Sun man returns from death to life (Part IV). The arch of vegetation gives its curve to sanctuaries set up for a definite Pūjā only; they are not meant to outlast the time of worship. They have no permanence but are always put to the same use. The large leaves of the banana fold into walls; or the temporary shrines are made of bamboo, etc., and withes. As many of these shrines as are set up, so many perish; quicker even than they had been built they are dismantled after the Pūjā; they belong to a tradition which does not date and is living.

The superstructure crowned by the Āmalaka or by the High Temple is the third and highest part of the ‘body’ of the monument, the Prāsāda;⁸⁰ the two other main parts of the temple being the solid base or socle, its altar; and the sanctuary with its vertical walls. By its form the Prāsāda leads from the square at the base to the point above; by its exalted position and by its form, which leads to the peak, the superstructure is the Mountain; its mass is the vesture (kośa) in which is clad

⁸⁰ It is crowned by the High Temple or the Āmalaka, and exceeded by the Stūpikā or finial. The latter is no longer part of its mass. The finial, Cūla (‘Agnipurāṇa’, CIV. 22) or Cūlaka (ib. LXI. 14, where the word is wrongly rendered as Vṛkala, Cubuka or Calaka) is above the Āmalasāraka (which is above the Kanṭha and the latter above the Vēdi); above the Cūlaka—in a temple of Viṣṇu—is the Sudarśana Cakra, Viṣṇu’s disc (ib.). This is one of the few passages which mention the emblem of the god to whom the temple is consecrated and which is placed on top of the finial.

The ‘Samarāṅgaṇasūtradhāra’ enumerates in many passages the several parts of the finial, the Candrikā or Padmaśirṣa, the Kalaśa or Kumbha and on it the Bijapūraka, Bijasvara, etc. (LVI. 153-154; LVII. 136, 425; 719). No comprehensive name is however given to the whole finial.

The ‘Tantrasamuccaya’, I. II. 50, describes the finial, the Stūpikā, as consisting of a Padma, lotus; Kumbha, vessel and Kuṇḍmala, lotus bud, etc. In an Alpa-prāsāda, the height of the Stūpikā is $\frac{1}{4}$ of the Mānasūtra or width of the Vimāna, and is equal to the height of the Adhiṣṭhāna (‘Īśānaśivagurudevapaddhati’, III. ch. XXX, see chart I, Part VII; also note 40, ib.).

In a certain class of South Indian temples, i.e. the “small temples” (Alpa-Prāsāda) (‘Tantrasamuccaya’, I. II. 52), the demarcation is conspicuous between the walls of the Prāsāda and the superstructure; it is brought about by an entablature (prastara) and a recessed part above it, the walls of the storey called Grīvā or Gala (neck), just as the shaft which emerges from the shoulder course of the superstructure and reaches up to the Āmalaka or forms the walls of the High Temple is a recess in proportion to the platform of the Vēdi, the Skandha, and is therefore also called Grīvā (gala, etc.). Thus six parts of the Prāsāda are distinguished in the vertical direction—Adhiṣṭhāna, the socle (with or without Upapiṭha, the pedestal), Pāda (the pillar or height of the wall) Prastara, Gala, Śikhara, and Stūpi. The adding of the superstructure (the High Temple) to the flat roofed lower temple is recorded in these divisions.

the Axis of the temple. This emerges, in its topmost portion only, as section of a mighty pillar, as the 'neck' (grīvā) of the temple, above the shoulder (skandha) of the superstructure. The symbol of the Pillar of the Universe inheres in the picture of the World-mountain.⁸¹ The World-mountain is its vesture, the offsets and buttresses of the Prāsāda are its folds. They have their origin in the Prāsāda itself which is the monument of Manifestation. They are bodied forth in rhythmical progression from its centre and vertical axis, on every one of its levels (bhūmi).

This rhythmical progression from the centre is particularly elaborated in the plan of the temples having a curvilinear Śikhara. Wherever the shape of the Tabernacle rests upon or encloses the walls of the dolmen-shrine placed on the altar-like base, the three main components of the Hindu temple are joined in the vertical direction by the high flung arches of multiple buttresses which clasp its sacred form (Pls. LXXI, XLIII). On the temples with a pyramidal superstructure, the buttresses are but rudiments, flat and without gradation (Fig. h; cf. plans in Part VII), without the scope of numberless variations of shape in which they step forth from the centre of the Garbhagrha and are joined below the Āmalaka of the curvilinear Śikhara.

The Prāsāda with a pyramidal superstructure upon the 'cube'—or prism⁸²—of its walls on the other hand preserves the distinctiveness of these two shapes (Fig. h). They cohere but do not coalesce. In plan, the walls with their flat buttresses where are the niches for the images, show their straight outline broken only by shallow effects in regular intervals (Fig. in Part VII); they do not jut out by being set off one against the other—as they do in temples having a curvilinear Śikhara—especially in the centre of each side whereby the walls of the square Garbhagrha and of the Śikhara assume the shape of a cross, in the plan and

⁸¹ In the endeavour to build up the temple as an image of the World-mountain various forms of sacred architecture were superimposed. Some of these were not destined to consolidate into generally accepted types. Undoubtedly experiments were made over and over again. The flat roofed apsidal Durga temple at Aihole, of the 6th century, received a curvilinear Śikhara, at a later date; the Hucchimaligudi Temple, possibly built in the fifth century, received a curvilinear Śikhara on its flat roof, in the sixth century, to judge from its style.

Of greater interest even is the Kuraja Bir Temple of the ninth century in Central India; it has a cell superposed on the Garbhagrha which forms its first floor; and on top of the second cell which forms its second storey, a complete curvilinear Śikhara is raised which leads this structure to its highest point or: the higher or second-floor Garbhagrha with its curvilinear Śikhara may be seen as one complete Prāsāda placed on a flat roofed temple (cf. Part V. note 94).

Finally, a complete temple with its curvilinear Śikhara is placed as a monument on top of a Gaudiya Temple—which itself has a curved roof, the brick translation of the thatched roof of the Bengal village temple or house (for instance in Viṣṇupur, Bengal, c. 17-18th century, illustrated on a Plate between pp. 92-93, by N. K. Bose, op. cit.).

The curvilinear Śikhara on top of various types of roofs of shrines is illustrated frequently in miniature paintings from Bengal from the eleventh century onward; cf. Foucher, 'Iconographie Bouddhique', Pl. III. 4. In all these compilations, it is the curvilinear Śikhara only which is given this exalted position; it soars towards the highest point from an already high level and forms the sheath of the 'axis of the universe', the central pillar whose shaft emerges from the platform (skandha) of its Vedi.

⁸² The height of the wall of the temple is equal to its width in principle (Part VII; in practice however it may be $\frac{3}{4}$ of it only, as for example in Orissa; note 61).

in any horizontal section. The proliferating vitality by which the square of the Garbhagrha is commuted into the cross, or into the circle of the stellate shape (Pl. XLIII) of the perimeter of the Prāsāda does not belong to the temple with the pyramidal superstructure.

However diversified the components and attributes of the temple with the pyramidal superstructure may be, the 'Jāti-vimāna' remains in principle a pyramid upon a cube, at all phases of its history.⁸³ The vertical section of its shape in all its variations has for its theme the square with the triangle above it. It is a version of the symbol of total manifestation 'more geometrico' and of its reduction to unity.⁸⁴ The 4 regions of space lie within the walls of the 'cube' of the Garbhagrha and the storeyed pyramid above it, the superstructure, leads to the unity of the point.

⁸³ The pyramid above the cube is to this day the form of simple shrines in Benares (cf. also R. L. Mitra, 'The Indo-Aryans', Vol. II). Here the 'original' stereometrical, symbolic form outlived its diversified appearance in the great monuments such as those of Bodh-gayā, or the South Indian Vimānas of about 1000 A.D.

As a peculiar version of the Śikhara with Uromañjarīs, the temple of Sinaria (Monghyr, Bihar) deserves mention. Applied in low relief to its pyramidal superstructure are triangular Uromañjarīs (ASI. Bihar and Orissa photographs, 1936-7 ; No. 4655).

⁸⁴ R. Guénon, 'La Tetraktys et le Carré de Quatre', É.T. 1937, pp. 140-145, treats of the quaternary as the number of universal manifestation. Its significance is cosmological (the 4 cardinal points, etc.) whereas the significance of the ternary is ontological. The unity is the first triangular number ; it is also the first square number. The second triangular number is $1 + 2 = 3$. 1 corresponds to the point of the triangle ; 2, being produced by the polarisation of the unity, corresponds to the extremities of the base of the triangle.

VII

PROPORTIONATE MEASUREMENT
AND
VARIETIES OF THE TEMPLE

प्रमाणे स्थापिता देवाः पूजार्हाश्च भवन्ति हि ।

“When the gods are set up with correct proportions then they can be worshipped.”

‘Samarāṅgaṇasūtradhāra’, XL. 13½.

पाचकः कटुतीक्ष्णाद्यैरनुसाररसैर्यथा ॥

अन्वीक्ष्य विपचेत् तद्वत् स्थपतिः सर्वमाचरेत् ।

यदुक्तं यदनुक्तं च तत् समग्रमपि स्फुटम् ॥

“As a cook cooks after testing various suitable flavours, the piquant, the sharp, etc., so should also the architect observe everything; whether stated explicitly or not, all (that is required) is clear (to him).”

ib., LV. 158b—159.

VII

1. PROPORTIONATE MEASUREMENT OF THE TEMPLE

THE RHYTHMIC DISPOSITION OF THE GROUND PLAN AND OF THE VERTICAL SECTION

The process of drawing the initial square is described in the same way throughout the Vāstu-śāstras. In the middle of the site the gnomon of a given length is fixed in the ground; attached to it is a string. A circle is drawn with a radius twice the peg. Where in the forenoon and the afternoon the shadow of the peg reaches the periphery of the circle, there lie the East and West points; the line which then is stretched between the two intersection points of the arcs, described from those two points, lies North to South. With the East-West and the North-South lines ascertained, the square should be drawn.¹ This cord or line is the Pramāṇa Sūtra. It comprises the co-ordinates of the Prāsāda. Outside, forming the perimeter of the temple, the circumscribing line, Paryanta-Sūtra, is stretched. The Vinyāsa-Sūtra comprises the lines which divide the Paryanta Sūtra; they assign their place to the 'Pada'-divinities ('Kāmikāgama', XVIII, 5-7; 'Mayamata', VI. 19-21) and to the buttresses of the walls.² These three groups of lines determine the rhythmical disposition of the plan (talacchanda) of the temple.

The threefold system of proportionate measure expressed by the Pramāṇasūtra, —originally the two main orthogonals of the square Prāsāda—, the Paryantasūtra, or its perimeter, and the Vinyāsasūtra, which gives the theme of the walls, is the rule of the ground plan of the Hindu temple in its most evolved types (Figs. on pp. 247, 250) and in its simplest form. The simplest form would consist of four internal squares brought about by the two main co-ordinates, the Brahmasthāna being congruous to the Garbhagrha. If a border of equal squares is added, they are twelve in number and occupy the thickness of the walls. In this plan there would be sixteen squares only; the Paryantasūtra would measure four times the length of a square on each side, and the Vinyāsasūtras would assign to the Devatās their

¹ See Part II, pp. 39 f.

² The 'Kāmikāgama', XVIII. 6, and LV. 117, makes it clear that the Paryanta Sūtra ends with 'Kūṭa, Koṣṭha', etc., i.e. with the projections of that name, from the wall of the Prāsāda.

The 'Kāśyapaśilpa' XXVIII. 2; XXIX. 2; 45; 60, etc., expresses all measurements in parts of the Mānasūtra (Pramāṇasūtra) and of the "space between the Vinyāsasūtras" dispensing with the Paryantasūtra. Although this terminology belongs to South Indian texts its principles are applied in Vāstuśāstra as known to us from the 'Bṛhat Samhitā', etc., in the sixth century A.D.

places within the wall space of the temple. This is in fact the ground plan of the first or general (sāmānya) norm, according to the 'Matsya Purāṇa', CCLXIX, 1-6 (Chart I).

Four kinds of proportionate measurement of the Prāsāda are given in the 'Matsya Purāṇa'. In the first, the plan is divided into sixteen squares; the height of the wall is equal to its outer length; the body of the Prāsāda is a cube; its high superstructure is twice as high as the width (w) of the Prāsāda (also 'Garuḍapurāṇa', I, XLVII). If the width of a square is 1 unit, the width of the Garbhagrha measures 2 such units, the width of the Prāsāda is 4; its height is 4 and that of its superstructure, the Śikhara, is 8.

The division of the Pramāṇasūtra is 1:2:1. This is also observed in the 'Bṛhat Saṃhitā' (LV. 11-16).³ The adjustment of the Maṇḍala of 64 squares to that of 16 squares has already been discussed (Part II, p. 58); here, it seems to have been suggested by the simplicity of the shrine; its plain, thick walls, without buttresses, belong to small structural temples in central India of the Gupta Age.⁴

A height of the Śikhara twice the width of the Prāsāda, and its total height thrice its width as in types I and III of the 'Matsyapurāṇa' are rare in preserved temples of any age.⁵ The 'Bṛhat Saṃhitā' on the other hand, and norms II and IV of the 'Matsyapurāṇa' show the total height of the temple as twice the width of the square of the Prāsāda. The proportionate measurement of plan and elevation in the three dimensions of space, and the conformity in principle of the plan and the Vāstumaṇḍala, underlie the general rules or norms of the temples in Vāstusāstra. Their several sets are put together in Chart I. On these fixed systems of proportion the elaborations and specific shapes are superimposed which distinguish each single variety of the temples. These Lakṣaṇas or specific features are listed in Chart II.

Referred to the Vāstupuruṣamaṇḍala the triple system of proportionate measurement pertains to (1) the co-ordinates of the Maṇḍala, (2) the perimeter of the Vāstu, and (3) to the border zone occupied by the 32 gods. For this reason too, the Vāstupuruṣamaṇḍala is drawn on the ground on which the Prāsāda is to be built ('Īśānaśivagurudevapaddhati', III. ch. XXVII, 59-60) as the prototype in whose conformity the measure of the plan is meted out. The drawing of that Maṇḍala sets the mind of the architect in tune and he plans the temple and builds it guided by its disposition. The drawing of the Maṇḍala gives the 'pitch' according to which the ground plan (talacchanda) has its consistency. When the great temples were built, after the ninth century and which still stand, the drawing of the Vāstupuruṣamaṇḍala had become an architectural rite without necessarily coinciding with the laying out of the ground plan of the Prāsāda.

³ Not all the measurements of the temple of the several types are detailed in each text. The proportions of the 'Bṛhat Saṃhitā' being based on the square of 8, are nearest to the 'principles' of the temple; the 'Matsyapurāṇa' where it deals with architecture, sums up subsequent practice.

⁴ The Nemī, the outer circumambulatory, provides for the buttresses, the Rathāṅga; their projection (nirgama) is given in proportionate measurement in other types of the Prāsāda (see Chart I).

⁵ Śikharas of this proportion or having even a greater height such as the Amṛteśvara Temple at Singhanapur (Cousens, 'Mediaeval Temples of the Dakhan', Pl. XCII) are rare. In wooden temples this excessive height might have been normal.

The three-fold proportions regulate the rhythmical disposition of the simple as well as of the most complex or evolved ground plan. Different varieties of temples and their plans are described for example in chapter LVII of the 'Samarāṅgaṇa-sūtradhāra'.⁶

The plans, p. 247 f, of the Prāsādas Kṣitibhūṣaṇa, Vijayabhadra and Hemakūṭa are drawn according to the 'Samarāṅgaṇasūtradhāra'.⁷ They belong to fully evolved structures, the one relatively simple in plan the others more elaborate, in which the original principles are worked out in their implications. These three varieties of temples have each an ambulatory outside the wall of the Garbhagrha; it is enclosed by the outer wall of the temple.⁸ The name of the walled-in ambulatory is Andhakārikā, being a blind (andha),⁹ in the sense of dark, ambulatory; the inner wall is called 'the wall' (bhitti) or inner wall (antarabhitti), or root-wall (kanda-bhitti); while the outer wall has only one name, (bāhya-bhitti), which means outer wall and shows that the inner wall is the original wall, by which the Garbhagrha is surrounded. This augmented plan is also organised in three respects: (1) along the orthogonals corresponding to the Pramāṇasūtra: (2) along the outside of each of the two sets of walls or the Paryantasūtra and (3) along the Vinyāsaśūtras and their extensions by which the projections and the vertical recesses of the wall are proportionately measured in their thickness or depth.

The balconies and 'halls' (bhadrā; śālā), that is the buttresses in the middle of each of the three sides of the Prāsāda which have the greatest projections (nirgama); the lesser offsets or buttresses (ratha, etc.), the vertical recessed chases (jalāntara, udakantara, etc. which means 'drain'), the width of all these are shown in the plan on the Paryantasūtra and their proportionate thickness is measured on the Vinyāsaśūtras.¹⁰ These are extended beyond the Kṣetra. This field is drawn

⁶ Actually 40 and 19 temples are described; in the other chapters of this most detailed treatise on architecture, ground plans similarly organised are indicated or taken for granted. The published text is not complete; after verse 210, ch. LVII, 50 verses are said to be missing of the manuscript. The prescriptions are not always fully given; this was not necessary as long as a living practice sustained the knowledge embodied in the text.

⁷ The drawing of the plan of the temple is explained on pp. 247 f.

⁸ For early examples with Andhakārikā or Andhārikā, see chart "The 20 Temples" and also the Temple of Golaganāth, Paṭṭadakal, (Photo ASI, Western circle, 1909-10, No. 3343), in addition to the temples already enumerated.

⁹ The synonyms are: Bhramaṇī, etc. see Part VI, note 44.

¹⁰ The measurement by these Śūtras or lines applies to the plan of the temple; the Mānaśūtra however is the module not only of its horizontal but also of its vertical proportions (Chart I).

A lesser module however is used for the 'accessory parts' (aṅga). Aṅgas are, for example, the mouldings of the socle, the Adhiṣṭhāna. Their recesses (praveśa) and projections (nirgama) are measured by Daṇḍa (or rod; 'Vaikhāṇasāgama', VI.; see also Part I. p. 10). This injunction, recorded about the 8th century, is repeated in the 'Īśānaśivagurudevapaddhati', IV. ch. XXXI. 36 (quoting Parāśara) of the 9th-11th century and in the 'Śilparatna', XXI. 46, of the late 16th century. There it is said "all Aṅgas of the Vimānas are measured by Daṇḍa. The width (vipula) of the wall pillar (kuḍya-stambha) at the top is called Daṇḍa". Later texts, it is shown below, apply the Daṇḍa measurement to pillars without any qualification or to the wall pillar (kuḍya stambha) or pilaster only.

The Daṇḍa as module for measuring proportionately pillars, pilasters, mouldings, etc. was used generally though not exclusively in South Indian Śāstras. The 'Vaikhāṇasāgama' speaks of three possible ways of the proportionate measurement of pillars:

first as square, as a rule; its rhythmical theme is given by the number of squares into which it is divided. In the 'Samarāṅgaṇasūtradhāra' the division is according to one or the other of the even numbers in the series of 10 to 28 as a rule. The figures on pp. 251, 47, 50 show a Kṣetra divided on each side into 12, 26 and 28 parts respectively.

The name for ground plan is Talacchanda, or rhythm of the floor; it is also designated as Samsthāna, though this term includes the vertical section of the ground-floor as well (S.S. ch. XLIX), its proportion (māna) and the assignment of the parts (talanyāsa) to their positions.

The plan of the Temple of Ambarnātha (p. 230A)¹¹ in the Konkan, Bombay Presidency, built in A.D. 1060, shows, to the left, the Prāsāda with its (nearly) square Garbhagrha and thick wall. It has no inner ambulatory and only one set of walls. The theme of its projections consists in one central Śālā on each side as broad as the interior of the Garbhagrha, and having a further offset narrower by one third approximately. The lateral bays (pratyāṅga) of the main buttress have 3 offsets on each of their two sides. A stepped and faceted wall of this Nirandhāra Prāsāda or 'temple without ambulatory' results from this simple plan with the Garbhagrha a square of 3, the Prāsāda covering an area of 5 such units square and the furthestmost projection of the wall extending to a distance of 3 such units from the Garbhagrha so that the square of three occupies the centre of a 'cruciform' plan measuring nine such units across its arms.

(1) by Daṇḍa; in this connection it is stated that, at the top of the Pāda (pillar, i.e. its shaft) the parts called Poṭikā, Virakaṇṭha and Phalakā should measure 1 or 3 Daṇḍas in height.

(2) It is said of the pillar (above the Adhiṣṭhāna) that its Veditā (lowermost part or base) should have a height 1/6, 1/7, 1/8 or 1/9 of the height of the pillar (pāda) from top to bottom. The width of the Pāda should be 1/7, 1/8, 1/9 or 1/10 of its height.

In this method of measuring, the height itself of the pillar is the unit of measurement. The height of the pillar (pāda=jaṅghā, see Chart I) however is given with reference to the Mānasūtra.

(3) It is also said that the width of the pillar (pāda-viṣkamṭha)—at the top—has as many Aṅgulas as the Vimāna or Mānasūtra has Hastas (i.e. the width of the pillar would thus be 1/24 of the Mānasūtra or width of the temple (vimāna). Later South Indian Śāstras connect or combine the possibilities (1) and (2) of the 'Vaikhāṇasāgama'. Their differences are referable possibly to wooden pillars on the one hand and pilasters of the timber or masonry wall on the other.

The 'Mayamata', XV. 28, and the 'Kāśyapaśilpa', VI. 15, speak of the pillar (pāda) without qualification and not of the wall pillar (kuḍya-stambha) only, whereas the 'Kāśyapaśilpa', VIII. 4-9, says that the width of the pillar (dārūpāda) at its base should be 1/7, 1/8, 1/9, 1/11 or 1/12 of its height. Similarly also the 'Tantrasamuccaya', I. II. 10 where 1/8, 1/9 or 1/10 of the height of the wooden pillar (dārūstambha) are given as the width at the base. The width of these pillars at the top is 7/8, 8/9 or 9/10 of the width of the respective base. The width of the Kuḍya-Stambha here is given as 1/2, 2/3 or 3/4 of that of the Dārūstambha.

Various methods were in use not only with regard to the pillar and its proportionate parts, but also when measuring the mouldings of the socle, (see Part V, note 50), and the projections were expressed in terms of their respective height. Whereas the diameter of the column at the base was often taken as a module of the Greek temple, in the Indian temple, the width of the 'pillar' at the top is the module of the mouldings, etc. or 'accessory parts' (aṅga) only.

¹¹ This plan of the temple at Ambarnāth has been published in the 'The Indian Antiquary', vol. III; another in 'Mediaeval Temples of the Dakhan', ASI. vol. XLVIII, Pl. IX. The latter plan shows in detail the wall facets of the 'pratyāṅgas'.

PLAN OF THE AMBARNÂTH TEMPLE

HALF PLAN LOOKING UP

HALF GROUND PLAN

PROPORTIONATE MEASUREMENT OF THE TEMPLE

The theme of the Prāsāda is transferred to the large Maṇḍapa, the hall in front of the temple. Such Maṇḍapas were added and form part of the Hindu temples in the later period only; in the earlier temples, the Maṇḍapa is but a broad porch in front of the Prāsāda (Chart I).

Central Part of the First Layer of the Agni
of the Soma Sacrifice

Central Part of the Fifth Layer of the Agni of the Soma
Sacrifice

The stepped plan of this temple follows closely the lay-out of the strata of the Agni of the Soma sacrifice (shown above).¹² A living memory builds the buttresses

¹² SBE. vol. XLIII. pp. 17 ; 98.

of the Hindu temple in a pattern similar to that by which the bricks were laid in the Vedic Altar. These offsets of the walls of the temple have but the appearance of buttresses without however fulfilling their structural purpose. While they strengthen the walls, they do not counteract any thrust; fundamentally they are the monumental consequence and form of a theme laid out from the centre, 'brick' by 'brick' (vinyāsa). When the Vāstupuruṣamaṇḍala is drawn on the square floor of the Prāsāda to be built the number of its squares is also that of the divisions of the ground plan of the temple. This however is in practice not the case in the later temples; the side of the principal Vāstupuruṣamaṇḍala of a Prāsāda is divided into 8 or 9 equal parts, respectively, etc., whereas the division of the square Kṣetra in the later mediaeval temples requires at least 10 parts (see *infra*). The Vāstumāṇḍala however remains the guiding principle or the prototype of all architectural division unaffected by the variety of temple types that rest on it. If, on the other hand, the Vāstumāṇḍala is co-extensive with the entire site plan of a temple establishment, the position of the shrines of the different divinities are assigned according to the plots occupied by the Vāstudevatās.¹³

With the prototype of the Vāstumāṇḍala as the tonic, the ground plan is laid out rhythmically 1) from the centre, 2) along its perimeter and 3) once more from there in rhythms in which is summed up the inner impact of movement; it acquires visibility on the outside of the building which is clasped by its indentations and arises in the gradations of its planes.¹⁴

¹³ A plan indicating the position of the images (and shrines) of the Parivāradevatās within a Viṣṇu temple of 7 enclosures is drawn by T. A. Gopinatha Rao, 'Elements of Hindu Iconography', Pt. ii, vol. I, Appendix A. The images are assigned to the 4 quarters and the intermediate directions and also to points in the middle or at other regular intervals between the quarters and sub-quarters. From there, diagonally towards the centre the images are placed.

While the image occupies the Brahmā-part (Brahmabhāga) in a Garbhagṛha whose side is divided into seven ('Agnipurāṇa', LX. 1 f.), the Liṅga should not be placed exactly in the centre of the Garbhagṛha but slightly north-east of it at the distance of half a barley corn or a barley corn (yava) in order to avoid the piercing (vedha) of the centre ('Agnipurāṇa', XCVII. 4-5). By this slight deviation the rules of the Vāstupuruṣamaṇḍala are obeyed and mechanical symmetry is being avoided.

¹⁴ See Plate XLIII. These offer their vertical surfaces into which are sunk niches containing images of the gods, or else the images protrude from the walls as if they had stepped forth from their vertical surfaces. They are set in niches (Pl. XLIII) or framed by any device (in Orissa, etc., also Pls. LXXI, III). In them the impact from the centre seems to be given iconographic shape. In this way also the images on the walls of the temple have their place rhythmically determined with ultimate reference to the Vāstumāṇḍala.

POSITION AND ORIENTATION OF THE TEMPLES

As the positions of the images are fixed in relation to the Vāstumāṇḍala underlying the Prāsāda, so are, theoretically at least, the positions determined of the various temples within any kind of settlement and also outside of it and in relation to it.

Hamlets, villages, market towns, citadels, cities, capitals and suburbs, all these walled habitations,¹⁵ as the Prāsāda itself, are laid out on the Vāstupuruṣa-māṇḍala, and the temples of the village or city have their place assigned on it. In practice, equal in Śaiva and Vaiṣṇava texts, the main position of a Śiva temple is in the North-East, in Īśāna, and that of a Viṣṇu temple in the West, in Varuṇa; the Centre is the place for the temple of Brahmā, or of Viṣṇu or of any other form of God as the main divinity of the temple. Buddha and Jina temples, which belong to the heretics, are assigned generally to the South-West. On all other points there is as much agreement as diversity in the different Śāstras, so that the 'Kāmikāgama', ch. XXVI. 6 lays down that in this, the 'Kāmikāgama', the situation of a temple of Gaṇeśa is in the West, or South-West or between the North-West and the North or elsewhere.¹⁶ In the chart on p. 234, several texts are put together which are more or less explicit on the positions of the temples. Where the temple of a divinity is set up depends upon the branch and phase of the tradition followed at the time and place of building. The worship of the Mothers, for example, whose temples and images the 'Kāmikāgama' gives as stationed in the North-East or the North (XXVI. 8), and other texts in the South, is said in this text (ib. 18) to have been performed but recently by the Brāhmaṇas. Apart from the positions of the Śiva principle in the North-East, Sūrya in the East, the Viṣṇu principle in the West and the Brahmā principle in the Centre, the temples of the many forms of God are frequently assigned more than one place even in each single text. The temple of Brahmā moreover according to South Indian tradition, it is explicitly enjoined in the 'Kāmikāgama', should not be in the centre; its place is in the SSW. and S. (ch. XLIX) or in the NE. (ch. XXVI. 2).

The latitude in assigning positions to the temples contrasts with the definite rules for their orientation; the margin of their application, however, is equally

¹⁵ The following are enumerated as walled habitations (prākārāntarathāvāsa) in the 'I.P.' III. ch. XXV, 13-15: Grāma, Khetaka, village, hamlet; Kharvaṭa, market town; Durga, citadel; Nagara, town, city; Rājadhānī, capital; Pattana, town; etc. etc. and Śākhānagara, suburb. In most of the other texts, all these walled settlements are implied in the designation "village, etc." (grāmādi).

¹⁶ cf. XXVI 7, where the position of a temple of Durgā is given in the South or South-West or North-West or East or between the South and South-West.

In chapter XLIX however of the same text, the 'Kāmikāgama', Subrahmaṇya is assigned to the SE, whereas the plots of Sugrīva or Varuṇa are his in ch. XXVI.

Some of the positions prescribed in ch. XLIX are given in the chart. This chapter moreover lays down in which directions Nāgara, Drāviḍa, Vesara and Sārvadeśika temples are to be built, not only in the eight directions, but for example in the SSW., etc.

The chart shows the positions of most, though not of all the temples given in the respective texts.

broad. Given any position it is of primary importance where the temple faces. In the orientation of the temples three principles combine (1) the orientation proper, for the temple should face the East, the rising sun; (2) the temples should face the Centre—of the settlement, the village or town, etc.; (3) God in his peaceful (śānta) image should be located in and turned towards, the habitations of men; God in his wrathful (ugra) image should be situated outside and face away from the habitations of men. The 'ugra' aspect of the image is linked up with the quality 'tamas', which implies destruction; and with Abhicārika rites.

The cosmic orientation, with reference to the Sun; the metaphysical orientation, with reference to the Centre of the Vāstupuruṣamaṇḍala and of every settlement of men; and the orientation with regard to man, the living being (jīva), his welfare and peace are the considerations which determine where a temple faces.

The first consideration is primeval and remains the basis of orientation. Most of the preserved temples face the East, others the West. It is therefore said that it is best if a temple has its door to the East and that it is good if its door is to the West. While however it is admissible that a temple faces South it is not desirable that it should face North.¹⁷ This is observed also when the second consideration prevails, for it is said that the temples in the East, should face West, and those in the West should face East, and the others clockwise (pradakṣiṇa) so that those in the North face South but those in the South should not face North ('Samarāṅgaṇasūtradhāra', X. 112). Not only the temples in the town should face its centre but also those outside the town. If for some reason, such as the terrain, etc., the temple and with it the image in the Garbhagrha have to face away from the town this is remedied by painting on the wall of the temple a likeness, identical in all iconographic matters to the image in the Garbhagrha. The painted proxy on one of the walls of the temple then faces the town, for in paintings, the gods may face in any direction (ib. X. 125; 128).

The temples and images that are turned away from the village or town are those which are not auspicious, says the same text (ib. 124). Temples of Narasimha should face away from the village ('Mānasāra', IX, 270) whereas all other images and temples of Viṣṇu should face the village or town (ib. 268). While images of Rudra are not to be placed within the settlements of men ('Kāmikāgama', I. c. 30), the image of Śiva in the North-East should also be outside and face away from the town ('Īśānaśivagurudevapaddhati', Pt. III. ch. XXV. 68). The latter applies also to temples of Śiva in the intermediate directions. Only those situated in the East or West should face the village, town, etc. ('Mānasāra', IX. 271-75). The latter two situations are not particularly those of Śiva temples; should these be built there, they conform with the rule valid for the other temples; like the gods of the Vāstupuruṣa-maṇḍala they all face the Brahmasthāna, the Centre. In its principle however, which is Tamas, destruction, the Śiva temple has its proper position in forests and on mountains ('Samarāṅgaṇasūtradhāra', X. 122). Even though a Śiva temple may be placed not only in the outer, but also in the inner border of the Vāstumaṇḍala, it should face away from the settlement of men.

¹⁷ 'Vaikhānasāgama' ch. II.—The cremation ground is to the north of the village, etc. and the Cāṇḍālas live there. The contagion of the dead body, its impurity, must not enter the temple.

The triple orientation, towards the Sun, towards the Centre and towards man, provides for diverse contingencies, so that summing up, in the 'Mānasāra' (l. c. 276), it is said that the main door of the temple of all images—except those of Viṣṇu, which always (but not in his terrible aspects) face the town, and those of Śiva which, as a rule, face away from it—may be in any direction. In truth, wherever the temple faces, to a Tāntrik the East lies between him and the image.¹⁸

¹⁸ "Pūjyapūjakayormadhye prācīṃ tu parikalpayet".

Dr. Coomaraswamy, in 'A New Approach to the Vedas', explains the orientation of temples, in accordance with 'Chāndogya Upaniṣad', III. 6. 11, and with the sunrise in the East, South, West and North respectively which depends on one's own spiritual condition; for the Sādhyas the sun rises in the Zenith and sets in the Nadir, and finally for those who know the essential truth of Brahman, the Gnostics, the Supreme Sun, risen in the Zenith, stands there in the middle, neither setting nor rising. . . . The direction of the rising sun, (whether E. S. W. N., spiritually) is always spoken of as East empirically.

THE NORMS OF PROPORTIONATE MEASUREMENT

(A) FROM THE SIXTH CENTURY A.D. TO c. 900 A.D.

The relatively few preserved shrines, from the fifth century A.D. and prior to the eighth century A.D., are sufficiently varied in plan and elevation to suggest that among the large number of temples which must have decayed and vanished further types were represented. Their differences were due partly to the integration of sanctuaries of heterogeneous origins into the Hindu temple. Manifold solutions were arrived at while embodying the dolmen type or also the 'hall' type (see *infra*, pp. 281-85) and others. By the sixth century, twenty shapes of temples are recorded (Chart II), each has a name and specific features.¹⁹ They are variations of certain fundamental themes or norms, by which are regulated the symmetry of their horizontal and vertical proportions; five or six norms of proportionate measurement, of which some admit of alternative versions, are given in the early texts dating from the sixth to the ninth century approximately (Chart I).

The module of proportionate measurement is either architectural or it is taken from the main cult object. The architectural module is the outer width of the wall of the temple, the *Mūlasūtra* or *Mānasūtra* of the square *Prāsāda* (Norms I, V, and IV), and secondarily also (Norm III) the inner width of the *Prāsāda* which is equal to the *Garbhagrha*. All the main horizontal as well as vertical proportions are referred to the *Mūlasūtra*, the basic width. This is differently expressed; the area of the *Prāsāda* is to be divided into 16 (Norm I) or 64 (Norm V) squares; its width is 4 or 8 units respectively and refers in either case to the *Vāstumaṇḍala* called *Maṇḍūka*. All the proportions here form octaves; the width of the *Garbhagrha* being 2, that of the *Prāsāda* is 4, this is also its height; it is a perfect cube and from it rises the *Śikhara* to twice this height; the wall measuring 4, the *Śikhara* has 8 units in height. The geometrical progression: width of *Garbhagrha*; width of *Prāsāda* or height of wall; and height of *Śikhara*—links the temple in its horizontal and vertical extent and interrelates their main parts. Analogous is the proportion between the thickness of the wall, its internal and external width. The ratio 2:1 or the Octave is the leading theme of the first norm as given in the '*Viśvakarmaprakāśa*'; with it is interwoven the Fifth, as the total height of this kind of temple is three times the width of the *Prāsāda*, the height of the *Śikhara* being two thirds of it.²⁰

¹⁹ *Sāmānya* or *Sarvasādhāraṇa* are the terms in the '*Viśvakarmaprakāśa*', '*Matsya*' and '*Agni-purāṇas*' (Ch. XLII) with reference to norm I of the *Prāsāda*. The '*Bṛhat Saṃhitā*', the earliest datable text, lays down only one norm or set of rules for the *Prāsāda* (Norm V, in Chart I). The '*Agnipurāṇa*', ch. CIV, includes under '*sāmānya lakṣaṇa*' three norms of proportions (see Chart I); the prescription of one or several norms precedes in each case the enumeration and description of the 'specific features', (*lakṣaṇa*), that is of the 20 or 45 varieties of temples. The '*Viśvakarmaprakāśa*' is the source of M.P., and the '*Hayaśirṣapañcarātra*' of A.P.

²⁰ The '*Garuḍa Purāṇa*', the '*Hayaśirṣapañcarātra*', and the '*Agnipurāṇa*', ch. XLII,

The 'Bṛhat Saṃhitā' gives only one Norm of proportionate measurement (V) and this not in detail,²¹ whereas the 'Viśvakarmaprakāśa' and 'Matsyapurāṇa' convey wider information. The total height of the temple in the 'Bṛhat Saṃhitā' is double the width of the Prāsāda.²² The thickness of the wall, its inner and outer width are related in the geometric progression 1 : 2 and 2 : 4, and analogously proportioned are the inner and outer widths of the wall—the latter however is not equal to its own height nor is the Śikhara twice as high—and the total height of the temple. The height of the wall, the Kaṭi, is 1/3rd of the total height; steps lead to it. The base, the Jagatī ('Viṣṇudharmottara', III. LXXXVI. 4), is also 1/3rd of the height of the building; also the superstructure. A high base is not provided by the norms of the 'Viśvakarmaprakāśa', etc.; the superstructure dominates, is double or at least equal to the rest of the building. Two sets of proportionate measurement are combined by Varāhamihira. The proportions of the entrance however once more form a geometric progression. The width of

follow Norm I of the 'Matsyapurāṇa'. The two latter texts use the term Jaṅghā (pillar) for the height of the wall, and Mañjarī (shoot) for Śikhara. In open, pillared buildings, such as are represented in Barhut the pillars (Jaṅghā) of the groundfloor support the second floor, etc.; and no walls are there. Jaṅghā originally denotes the pillar and has its meaning—in some cases also its shape (Pl. XLIII) transferred to the wall.

Jaṅghā, in the 'Garuḍa Purāṇa' denotes the vertically divided part of the wall corresponding to the 'uprights' or shafts of pillars. It is the lower part of the wall (bhitti), its upper portion or entablature with its horizontal mouldings is the Ūrdhvakṣetra; this term however may as well connote the lower part of the wall, i.e., the Vedibandha, or the socle. The text not being explicit, the above rendering of Ūrdhvakṣetra is only tentative.—Cf. the Jaṅghā in Orissan architecture. The G.P. and A.P., ch. CIV, treat of the "45 Temples" (p. 277).

²¹ The 'Bṛ. Saṃ.', LV. 11, says: "The height of the Prāsāda should be twice its width; the Kaṭi of the Prāsāda should be one-third of its (the Prāsāda's) height. That is called Kaṭi (=hip, above the Jagatī) where the temple starts from above the steps" (ib., comm.). In the commentary on śl. 16 however, Kāśyapa says that the Kaṭi is 1/3rd of the width of the Prāsāda. A plain stone wall (Kaṭi) or one of timber, having pilasters, etc. (Jaṅghā) and following in its division their structure, were described originally by different names. This led to discussions of the respective proportions. The Br. S. LV. 29-30, recounts a seeming discrepancy of measurements as given by Viśvakarman and Maya. The height of a storey (bhūmi) is said to be 84 aṅgulas by the one preceptor and 108 by the other. The difference however is accounted for: The height of the Kapotapāli (the 'ūrdhvakṣetra') is not included in Viśvakarmā's statement.—A reconstruction of the temples on the basis of their proportions as given in Vāstu-śāstra, will be possible only when further sources are explored. The 'Viṣṇudharmottara' describes temples which have found no place amongst the temples of the texts collected in charts I, II, etc. 'Jagatī is employed in the 'Hayaśirṣapañcarātra' and the 'Agnipurāṇa'. Jagatī means 'earth' and covers the raised ground, platform or terrace from which the temple rises. In the later usage it is the name of a horizontal moulding only (Part V. note 50).

The width (vistāra) of the Jagatī varies from one-third to four times the width of the Prāsāda. The two last named texts explicitly speak about the width of the Jagatī and give it as equal to or double the height of the Śikhara of the temple. The method of expressing the proportionate measurements of the horizontal parts of the temple with reference to the vertical ones and the vertical with reference to the horizontal shows that the building was regarded as a three dimensional unit interconnected in all its parts.

Such wide terraces or plinths are in existence in the temples at Bhitargaon and Deogarh.

²² Cf. N. K. Bose, 'Canons of Orissan Architecture', op. cit., p. 93.

the doorjambs being equal to the space or width of the threshold, the width and height of the door again form the geometric progression 1, 2, 4. This is given in detail in the 'Bṛhat Saṃhitā' with reference to the temple whose height is twice its width.

Not only on the outside but also in the interior is the division by three fitted into the leading proportions. It is introduced at the very centre of the Garbhagrha, by the height of the image. It is two-thirds of the height of the door, yet not of the complete height but of seven-eighths of it. Together with its pedestal which has half the height of the image it extends to seven-eighths of the door. Were it equal in height to the door, this absolute integrity would not appear so to the eye. The image would then not look as if framed by the entrance, and housed in the shrine, but it would touch the height of the lintle and seem to cut across it.

The Prāsāda, built according to Norm I or V, in their horizontal and vertical proportions and the interrelation of these, are essentially based on the division of the area of the Prāsāda in 64 or 16 squares (pada) respectively. This principle laid down in the Maṇḍuka plan, of which the maṇḍala of 16 squares is a reduction, regulates the coherence of the building in the three dimensions.

In Norm IV, of the 'Matsyapurāṇa' the width of the Prāsāda is to be divided into three parts; the outer width being 3, the inner width of the wall which is that of the Garbhagrha is given as 2; with the introduction of the ratio 3 : 2 corresponding to the Fifth, in the ground plan, the main vertical proportion, *i.e.*, of the superstructure, the Śikhara, to the perpendicular wall remains that of the Octave, 4 : 2, while the ratio of the width of the Prāsāda and its height, is 3 : 6. This shows the two themes, the horizontal and the vertical, linked and combined. While the single parts of the temple are measured by the module of which they are a multiple or an aliquot part, they are also referred the one to the other and their proportions are expressed by each other. In Norm II, the Śikhara is divided into 4 parts of which the two lower are designated as Mañjarī; half its height is that of the Śukanāsā. Above the Mañjarī is the Vēdi, its height is 1 part and so is that of Kanṭha and Āmalasāraka. Mañjarī, however, in the H.P., is a synonym of Śikhara; the Śukanāsā has half its height. This great height distinguishes the Śukanāsā of some of the earlier extant temples.

In the Prāsāda, Norm III, the width of the Garbhagrha being divided into three equal parts, the respective measurements of the ground plan form an odd series (viṣama) : 1, 3, 5. While the ratio of the widths of the outer to the inner square of the temple is 5 : 3, that of the width of the Prāsāda to its height is 1 : 3, the height of its Śikhara in relation to the wall is 2 : 1, and its total height to the Śikhara 3 : 2; this corresponds to the ratios of the Octave and the Fifth.

In Norm II, finally, the module is not architectural; it is the height of the sacred object housed in the Prāsāda : the Liṅga, or the image. While the main architectural module is invariably taken from an horizontal extension this is vertical. The architectural module belongs to the lay-out of the Citi, the massive pile, which is the support of Liṅga or image. The vertical direction of the latter, however, which is that of ascent, is imparted as module to the building according to Norm II. Its main measures in the plan, the width of Prāsāda and Garbhagrha, are also those of Norm IV of the 'Viśvakarmaprakāśa' and the 'Matsyapurāṇa' whereas the proportions of its vertical section agree with those of Norms I and III.

The 'Garuḍa Purāṇa' gives different proportions which also have the height

of the Liṅga as module (Norm IIA). They are 4:2, 4:8, 4:4; the proportions in the plan form the geometric progression 1:2:4 whereas the ground plan of Norm II does not yield any of the 14 classes of series (śreḍhī) nor the geometrically progressive series (guṇa saṅkalita) of Indian mathematics.²³

The main architectural parts of the temple, in the horizontal and the vertical, form progressive series, arithmetical or geometrical in the ground plan, and geometric—or harmonic—in the measures of the plan and the vertical section of the temple.²⁴ The harmonic proportion is established between the width of Garbhagrha and Prāsāda; the width or height of the wall and the height of the Śikhara (Norm I); or, between the widths of Garbhagrha and Prāsāda, and the width of the Prāsāda to its total height (Norm IIA and V). In Norm III, the width of the Prāsāda = the height of its wall, the height of the Śikhara and the total height of the Prāsāda form the progressive series 5:10:15. With these series are combined as proportionate measurements, the ratios, 2:1, and 3:2 corresponding to the Octave and to the Fifth in music.²⁵

The 'Bṛhat Saṃhitā' gives the purest type in which the parts are related with each other and with the whole in a geometrically progressive series. The temple, moreover, is based on the Maṇḍuka-maṇḍala. The pure Octave prevails in the proportions of the plan and also of the plan and the height of the Prāsāda. The Fifth, the ratio 3:2 is introduced in the height of the image and its pedestal and a division by three is effected of the height of the temple. The 'Bṛhat Saṃhitā' however is silent about the proportions of the Śikhara; the 'Bhaviṣya Purāṇa', at a later date, repeats the statement and omission of the 'Bṛhat Saṃhitā' in which two sets of norms appear to have been fused. They belong to different types of structures. The elevation of the one consists of three main parts of equal height: the socle, the perpendicular walls and the superstructure or roof ('Viṣṇudharmottara'; see Appendix) whereas the other has two main parts, the walls and the superstructure, the latter equal in height to the wall or twice as high. The norms of the other set are given in the 'Viśvakarmaprakāśa', etc. (Chart I); they include the sections of the Śikhara. The Śukanāsā plays an important part.

Śukanāsā means the 'nose' or beak of a parrot, its outlines are curved; Śukanāghri means 'parrot pillar'; the height and also the projection from the body of the curvilinear Śikhara, to which this 'nose' or 'pillar' belongs, are given. Another name for pillar is 'Jaṅghā' the latter being commonly used to denote the wall; 'nose' or pillar here denote the same, an antefix or wall-like projecting part of a particular shape, on the Śikhara of which it occupies, according to the early texts, $\frac{1}{4}$ or $\frac{1}{2}$ of the

²³ Gurugovinda Chakravarti in an article on 'The Growth and Development of Progressive Series in India', 'Journal of the Department of Letters', Calcutta University, vol. XXIV, states that "the Hindus were acquainted with the arithmetic and geometric series only. The harmonic series is purely a Greek contribution". It is however "historically recorded that sacrificial altars were constructed in ancient India in accordance with the proportions of the root rectangles" (J. Hambidge, 'The Parthenon'; Introduction by L. D. Caskey, p. XVI).

²⁴ The measures of the ground plan, according to Norm II, which are 1, 4, 6 respectively, are the only exception.

²⁵ These ratios in music, are between lengths of identical strings and at the same tension. Numerically these musical intervals correspond with the ratios of the proportionate measurements of the temple.

total height. In later temples, (Pls. XLVII, XLVIII) the proportion of Śukanāsā and Śikhara are different. Śuka, in this combination, does not indicate the curvilinear shape of the Śikhara to which the Nāsā is attached. Nāsā, Mahānāsā and Nāsikā are terms widely used in later texts from South India ('Kāśyapaśilpa', XXII; 'Śilparatna', XXXV, 1-27, etc.) where they denote exactly the same shape as in the early texts; the structural function of the Śukanāsā is linked with the meaning of its curved, symbolical shape. As symbolic form it appears, repeated on the four sides of the Śikhara, on its body, but in South India Nāsās and Nāsikās flank the Śikhara or cupola of the high Temple of the superstructure; its Bhūmis are beset with them (Fig. h, p. 187) and small 'Nāsīs' are carved even at the base of the temple.²⁶

Śukanāsā or Śukāṅghri is a projection from the main body of the Śikhara; it has $\frac{1}{4}$ or $\frac{1}{2}$ its height, and one third or one fifth part (Norm VA) of its own height is the proportionate measure of the projection (nīrgama) of this compact, shield-like antefix to the body of the Śikhara. Its width is equal to that of the Garbhagrha ('Garuḍa Purāṇa', I. XLVII. 3). Its outlines are curvilinear, its shape is that of the 'sun-window' proper or Gavākṣa (literally "ray-eye"); its archivolt is filled with many figures and augmented by further images; it generally wells forth from the mouth of a Kīrttimukha (Pls. XLIII. ff.).²⁷ The original position of the Śukanāsā is on the front of the Śikhara. Amongst the preserved temples, some in western India, the Pāpanātha temple in Paṭṭadakal shows the Śukanāsā about half as high as the Śikhara; in temples built subsequently, for instance in Gwalior (Pls. XLV-XLVIII) or Orissa, its replica, diminished in size (Śukanāsikā) is combined with the central offset ('latā'; or also 'pāga') in the three remaining cardinal points on the Śikharas. Incorporated in its bulk it retains the symbolic value of the original position. Its 'place value' accompanies it, as it does also other architectural forms whose original structural function is remembered, in its symbolic suggestiveness even where it is no longer put to any practical use. This refers also to the doors which have become massive doors (ghana-dvāra) or niches, in the four main directions at first, and then at regular intervals on the walls and to all kinds of the equally solid 'Sun window', the Gavākṣa or Nāsikā. This, from being the 'eye' or curve (akṣa) through which pass the sun's rays into the temple—as is seen in the rock-cut Buddhist temples where this early Indian architectural form is preserved, in its petrified state—was converted into a paradoxical shape, a solid window, symbol of the radiance of the Light from within the temple. Repeated in its reverse function as unit of form, the Gavākṣa became a lace-like pattern of indefinite extensiveness made to fit any shape to which it was applied (Pls. XLIII, LXXI, etc.). Such proliferations carry in each of their units the original meaning or function including that of their place.

²⁶ The 'Kāśyapaśilpa', XXII. 1-25, treats of varieties of the Mahānāsā and Kṣudranāsā.

The 'Brhacchilpaśāstra' presupposes the 'Samarāṅgaṇasūtradhāra'. It is a later compilation and has a Gujerati Commentary. In Part III. 95, the Śukanāsā is assigned, 9, 10, 11, 12 or 13 parts out of the 21 parts of the Śikhara, from the flat roof or ceiling (chādyā) to the shoulder course (skandha); it is about half the height of the Śikhara.

Re. Kṣudranāsā, or small Nāsā, see also 'Mānasāra', XIV. 236, etc.; Śukanāsā does not designate the curvilinear Śikhara, as assumed by R. P. Chanda, 'Rūpaṃ', 1. c.

²⁷ See Part VIII; Gavākṣa, Kīrttimukha, etc.

The original place of the Śukanāsā is above the architrave or entablature of the temple, in front, where the entrance is. There the weight, above the architrave, of the superstructure, the Śikhara, is lessened, especially in brick structures, by a large corbelled opening. Stone permits of deeper corbelled projections than brick; the vertical opening in the front face need not be as high as in a brick temple.²⁸ The closing stone fixed like a protruding shield in front of this opening is the Śukanāsā; it has the shape of a blind window or massive Gavākṣa. Its thickness is given in proportion to its height. The 'Īśānaśivagurudevapaddhati', III. ch. XXIX, 3, a later text dealing with the South Indian type of the temple, gives to the Mahānāsī corresponding to the Śukanāsā in front of the building, in its original position, a projection which has half the width of the Garbha.²⁹

Vedi is the attenuated portion of the Śikhara; it is half as high as the lower part of the Śikhara having the Śukanāsā and just above it. The lower half of the Śikhara, in the V. P., VI. 66, etc., is called Mañjarī. The two, the part of the Śikhara thus designated and the Vedi form its body or trunk and lead from the vertical wall of the Prāsāda in an ascending curve toward the highest point of the finial. They do not reach it though, for the Śikhara being truncated, the Vedi is topped by a flat horizontal surface (skandha). Mañjarī is also used as a synonym of Śikhara.

Kaṇṭha, the 'neck', is the narrow, tubular portion above the Vedi or 'altar' (Pl. I) and it holds up the Āmalaka (=Āmalasāraka), the cogged ring-stone which is also known as Anḍa. Kaṇṭha and Āmalasāraka are the crowning portions of the Śikhara, above its truncated body whose curves lead towards the highest point of the finial, above the Āmalaka.

Corresponding to the sections and parts of the Śikhara, the perpendicular walls of the more elaborate temples too are described in their horizontal structure; its main portion is the zone of the pillars and is thus also appropriately called Jaṅghā. The zone above this corresponds to the entablature, having an architrave, cornice (Kapota)³⁰ and other corresponding mouldings, etc. It may be called the "upper region" (ūrdhvakṣetra). This name however may also be applied to the zone below the pillars where it would denote the lowermost part of the wall, above the ground,—the socle projecting by an aliquot part of its height.

The 'Matsyapurāṇa' gives variations of the pure norm of the 'Bṛhatsamhitā'. Norms V and I are the primary alternatives when the height of the temple is twice or thrice the width of the Prāsāda.

²⁸ In certain stone temples, within their Śikharas, a second and sometimes even a third chamber, etc., are placed above the Garbhagṛha. (See part VI).

²⁹ In the Virūpākṣa temple in Paṭṭadakal, Cousens, op. cit. Pls. XXXVII, XL, XLV, the Śukanāsā almost answers this description. The height of the Śukanāsā of this Drāviḍa temple exceeds however half the height of the superstructure.

³⁰ The shape of the Kapota or roll cornice is derived from the edge of the thatch and the primitive dripstone cut above cave dwellings to prevent the rain from running in (Coomaraswamy, 'Indian Architectural Terms', l.c. p. 260). Its name means 'dove'; but, far from being a dove-cot, its function is not only to prevent the rain but also the doves from coming in. The 'Samarāṅgaṇasūtradhāra', XLVI, 17 f. speaks of the defilement and of the various misfortunes should a dove enter a Prāsāda; propitiatory rites have to be performed for the pigeon is the image of Kāla (Kālamūrti), of Time and Death; it is the repository of the root-evil. The bird of Aphrodite, in India is the bird of Yama.

The 'Agnipurāṇa', ch. CIV, appears to be later than ch. XLII although it also adheres to the division of the Śikhara as given in the 'Garuda Purāṇa', but it admits four alternative proportions of the total height and the width of the Prāsāda; the height is twice, two and a quarter, two and a half, or three times the width.³¹ In these less pure proportions, a concession is made to the contingencies of buildings; an increasing number of possible alternative proportions and further varieties in the division of the square plan of Norm I (Chart I), etc., belong to an age when adjustments were made on the basis of the pure proportions in building the house of God in all parts of India, and in each place according to the special local facilities.

Proportionate measurement, it has been shown, is meted out by means of an architectural module or else the Liṅga or the image is the module. In the latter instance the 'Matsyapurāṇa', CCLXIX. 26, speaks of Liṅgamāna³² whereas Rūpabheda denotes the divisions (bheda) of the building by a modification (bheda) of its form (rūpa), referred to the architectural module. Each of the norms of proportionate measurement comprises three classes of temples, best, middle and least.³³

To which type of extant temples do these norms refer? Some of the names of their parts appear to allow a more definite view than their proportions alone would enable us to hold. Mañjarī, as part of or equivalent to Śikhara, appears to imply the curve of a young shoot; it is a curvilinear superstructure. Vēdi, in more recent texts, is the name of exactly the corresponding portion of the Śikhara in Orissa, where the Gaṇḍi of the Bāra Deul is curvilinear, and Āmalaka is the cogged ring-stone above the neck (kaṇṭha) of the curvilinear Śikhara.³⁴ These names taken together with the proportions seem to refer to type II, covering its varieties and development from the sixth to the ninth century approximately.

³¹ The chronological sequence of the texts is indicated in Chart I from the 'Viśvakarma-prakāśa' and the 'Bṛhat Samhita' of the 6th century A.D. to the later chapter of the 'Agni Purāṇa' which corresponds to mediaeval structures (10th century). The 'Hayaśiṅṣapañcarātra' precedes the 'Agni Purāṇa' which has copied it. Chapters I-XIV only of the 'Hayaśiṅṣapañcarātra' are referred to. See Appendix.

³² The height of the Liṅga is equal to the width of the Pīṭhikā, the 'pedestal' of the Liṅga, which forms the central square of the Garbhagrha. The border-space is called Piṇḍikā, in the 'Matsyapurāṇa', whereas it is called Garbha in the 'Hayaśiṅṣapañcarātra' and in the 'Agnipurāṇa'. In the last-mentioned texts, Piṇḍikā denotes the central square whose width = the height of the image or Liṅga. Garbha and Piṇḍa (Piṇḍikā) on the one hand; Pīṭhikā and Piṇḍikā on the other, are synonyms, the first pair signifies the germ, the expanding 'embryo', and the second the pedestal.

³³ 'Matsyapurāṇa', ib.; no clearer explanation of these three terms, 'Jyeṣṭha, Madhyama, Kaniṣṭha' is given there; later texts ('Agnipurāṇa', ch. CIV), etc. however give all the details of this classification in terms of measure.

³⁴ The Āmalaka is also the crown of certain varieties of the rectilinear Śikhara (Part VI).

(B) PROPORTIONATE MEASUREMENT ABOUT 1000 A.D.

In the 'Samarāṅgaṇasūtradhāra', a standard compendium on Indian architecture of the early eleventh century, can be seen modifications in the proportionate measurement of the Prāsāda. The pure proportions of the early texts are no longer observed in the vertical dimension (unmāna) but they remain binding in the plan. The Śukanāsā which extended originally to half the height of the Śikhara is now given various commensurable height in the different temples (S.S. LV. 91-93).³⁵

The different height at which the Śukanāsā may terminate however is not an arbitrary nor an isolated measure on the body of the temple for it regulates the height of the Maṇḍapa; its finial must end below it. The Maṇḍapa is now established as a separate hall in front of the Prāsāda;³⁶ preparatory and subservient to the purpose of the Prāsāda. The walls of this semi-detached hall are extended from those of the Prāsāda (Figs. on pp. 255 f) and are regulated in their proportions and theme by those of the Prāsāda.

The Garbhagrha or Jaṭhara,—“the womb”—as it is also called (S.S. LIX. 29) retains in principle its original proportions as given in the early texts. In a temple with one set of walls only its width is half of that of the Prāsāda or Sīmā which may be assumed to have 10 equal parts. The Śukanāsā, at its bottom, has the width of the Garbhagrha (LV. 94-100) or 5 parts; one and a half time the width of the Garbhagrha or (garbhasūtra) is the height of that part of the Śikhara which is called its chest (uras); above it is the head (śiras); the height of the latter is half of the height of the chest (uras) or it may be one quarter only of its height (S.S. LV. 88-101). In other words, if the Mūlasūtra is divided into 10 parts, the height of the body of the Śikhara $11\frac{1}{4}$ or $9\frac{3}{8}$ such parts.

The height of the Śikhara however exceeds, as a rule, its width at the bottom, or the Mūlasūtra. If the width be 6, the height is $6\frac{1}{2}$ in one type of temple, $7\frac{1}{2}$ or $1\frac{1}{4}$ of the width in another variety (see below). In the temple called Vimāna, the width at the bottom of the Śikhara is 8, its height is $9\frac{1}{2}$, whereas in yet another temple, the height of the Śikhara is one and a quarter its width at the base.³⁷ Such variations are made in view of the physiognomy of each individual variety of the

³⁵ Excepting the 'Viśvakarmaprakāśa' the earlier texts are not full treatises on architecture but form part of large compendia; it may be objected that the pure proportions given there formed only the general rule and that many variations were implied. While this may have been so, chapter CIV of the 'Agnipurāna', shows that this great compendium is aware of less pure proportions in one of its later chapters while the pure proportions are known to it in an earlier context (chapter XLII).

³⁶ In the early temples of the 'Bṛhat Samhitā' etc. and the Gupta age the Maṇḍapa was a broad porch of the Prāsāda; subsequently a separate building became added to the Prāsāda which did not harmonize with it from the start as can be seen in the Paraśurāmeśvar Temple at Bhuvaneśvar, Orissa. Within the tenth century however the Maṇḍapa had become part of the temple and was regulated in its dimensions by the proportions of the Prāsāda; it always conforms with its architectural theme and within it appears frequently as a prelude or else as a counterplayer to that of the Prāsāda. The separate 'early' Maṇḍapas are described in V.P. VI. 124-136.

³⁷ S. S. LVI. 161; 165; 175; 176-181. This is its proportion in the 'Bṛhacchilpaśāstra', III. 82.

temple; they are in consideration of its Lakṣaṇas or specific features which adorn the underlying rules (S.S. LVI. 114).³⁸

The trunk of the Śikhara or Mañjarī which is referred to here is curvilinear.³⁹ Its curvature varies not only with the height of the Skandha, the shoulder course, from the base of the Śikhara but depends also on further factors. The name of this curvilinear shape is Padmakōśa or Veṇukōśa and means a sheath, which is compared to the petals of the lotus flower (padma) around the pericarp, or as Veṇukōśa, describes the curvilinear shape as a sheath of that reed (veṇu) or channel which itself encloses the vertical axis of the Prāsāda and exceeds the trunk of the Śikhara in the shape of the shaft or neck (kaṇṭha, grīvā) on which rests the Āmalaka.

In the early texts, in the 6th century etc., the total height of the temple including the Āmalaka was twice or else thrice its width. The general rule half a millennium later, as given in the 'Samarāṅgaṇasūtradhāra' however is that the height of the temple to its shoulder-course (skandha) is twice, two and a half times, and "2 small parts (kalā)"—or two times and a quarter the width of the Prāsāda (S.S. LVII. 122; 329; 455; 492, etc.). Above the shoulder-course of the curvilinear Śikhara are the neck (kaṇṭha, grīvā) and the Āmalasāraka or Aṇḍaka, which yet form part of the Śikhara. Above the Āmalasāraka, i.e., above the Śikhara, is the finial which is composed of several parts; the Candrikā also called Padmaśīrṣa, has the shape of an inverted flat bowl. It supports the jar, Kalaśa or Kumbha and on it is placed the Bijapūraka, the shape of the citron, or an Uṣṇīṣa (S.S. LVI-LIX, passim).

The proportions of the various parts above the shoulder course are now taken from the width of the Skandha; the height of the Āmalasāraka for example is given as one part, according to the number of parts, into which the Skandha is divided. If for instance, in the temple Nandiśāla (S.S. LVI. 148-155), having a Mūlasūtra of 12 parts, the Skandha or Skandhakośāntara, the inner sheath of the Veṇu—the latter being the vertical column of the Prāsāda—is divided into 3 parts, the height of the Neck has $\frac{1}{2}$, the Āmalaka 1, the Kumbha 1 and the Padmaśīrṣa $\frac{1}{2}$ part.

These vertical proportions are fractions of the width of the Skandhakośāntara; this again is referred to the width of the field (kṣetra) of the Prāsāda or Mūlasūtra; being, as a rule, three-fifths of its extent. The height of the portions above the Skandha of the temple called Nandiśāla in units of the width of this Prāsāda is $7\frac{1}{5}$ out of its 12 parts.⁴⁰

³⁸ "Yathārham tu yathāśobham"; 'Īśānaśivagurudevapaddhati'; III. ch. XXVIII. 42.

With an increasing latitude in the selection of the correspondence of forms on the basis of the rhythms underlying the entire structure, beauty becomes the regulating factor. Beauty is an outcome of the response by the Sthapati to the given theme and to the fundamental rhythms.

³⁹ Re. the construction of the curvilinear superstructure of the Prāsāda, i.e. the Śikhara, see Part VI. In the drawings on pp. 209-10, the base is assumed to have 10 and the height 11 parts.

⁴⁰ The 'Agnipurāṇa', LXI. 13-14, enumerates the Vēdi, Kaṇṭha and Āmalasāraka; the Cūla and Sudarśana: in CIV. 22, the height of the Cūla (=Cūḍā, crest) is given as half the height of the Grīvā, the neck.

The base (pīṭha; adhiṣṭhāna, etc.) is but rarely (cf. the temple Rucaka) referred to. The Vedibandha, the horizontal mouldings at the base of the wall however are specified (cf. note 41).

If the Garbhagr̥ha has one wall only, the temple is Nirandhāra and has no internal circumambulatory; if the Jāthara is ensconced by two walls and an ambulatory the temple is Sāndhāra (S.S. LVI. 21.). The general proportion of a temple with one set of walls only (nirandhāra) of which the temple Rucaka is the prototype is that the basic square, the Kṣetra, having a width of 4 parts, the Garbhagr̥ha has 2 and the thickness of the wall has one part (S.S. LVI. 44-50). The height of the lower part of its perpendicular wall, the Jaṅghā, has 2 parts and rests on a socle or base (pīṭha) half its height. The entablature above the Jaṅghā consists of Mekhalā and Antarapatra, the former a roll cornice or eaves shaped moulding and the latter a recessed course or "inner blade"; it has $\frac{1}{2}$ part in height; and the moulding, its name is generally Mekhalā, the 'girdle', but also Varandī (verandah), is given 1 part; these are synonyms for and variations of the Kapota, the roll cornice (S.S. LIX. 133; LVI. 119; 133). The perpendicular part of the temple is thus $4\frac{1}{2}$ parts high and is not a perfect cube, as in the earlier temples. The mouldings of the entablature or crowning part of the walls have different names and shapes, similarly also the mouldings at the foot of the wall (Vedikā or Vedibandha),⁴¹ such as the Antarapatra and Mekhalā, so that the same profiles belong to mouldings of the wall at the base and also to the wall portion above the Jaṅghā. From this entablature or upper portion (ūrdhvakṣetra) of the wall, from the Mekhalā, rises the Śikhara up to a height of four and a quarter parts of the Mūlasūtra (LVI. 48).

In front of the temple Rucaka is a pillared porch, three parts wide and 2 parts deep. The model Rucaka is a small temple without inner ambulatory. It has no separate structure placed in front of its entrance; its Maṇḍapa is a pillared porch only as it has been in the earlier temples. Now, however, a large Maṇḍapa or hall structure is placed contiguously in front of the more important temples⁴² whether they are Nirandhāra or have an inner ambulatory (Figs. on pp. 255 f).

Plans (talacchanda) of some Sāndhāra Prāsādas are drawn here following the 'Samarāṅgaṇasūtradhāra'. The proportions of their elevations are also given.

The proportions of the base however are most elaborately dealt with in the South Indian Śāstras and such chapters of the general treatises which deal with the South Indian temples (see infra).

Two approximate drawings showing the profiles of the Adhiṣṭhāna and Vedikā (from ASI. Rep. vol. VII, Pl. XII and vol. VIII, Pl. VII) of the Lakṣmaṇa Temple in Khajuraho and the Nīlakaṇṭheśvara Temple in Udayapur (Pl. XLII) are given on p. 259 f. The names of the mouldings, etc. are added following their descriptions in the 'Samarāṅgaṇasūtradhāra' ch. LXI dealing with the 5 kinds of bases (pīṭha) of 'Drāviḍa Temples'; Śilparatna', ch. XIX. (on Adhiṣṭhāna; 'Vāstu vidyā', ch. IX, and other South Indian texts).—Partly the same, but also different names are used in other localities, cf. Burgess-Cousens, 'Architectural Antiquities of Northern Gujerat' and N. K. Bose, 'Canons of Orissan Architecture'. In the latter work (and also by M. M. Ganguly, op. cit.) attempts have been made to measure the proportions of the extant temples.

⁴¹ S.S. LVII, 25-26 describes the mouldings of the Vedibandha as: Kumbha $4/9$; Masūraka $2/9$; Antarapatra $1/9$ of its height.

LVII. 61-67; divides the Vedibandha differently, not into 9 but into seven parts; of these Kumbha has $3\frac{1}{2}$ parts, Kalaśa $1\frac{1}{2}$, Antarapatra $\frac{1}{2}$ and Kapotālī $1\frac{1}{2}$ parts.

⁴² In the 'Hall temples', described in the 'Samarāṅgaṇasūtradhāra', of which however few buildings such as the Lad Khan Temple in Aihole and several temples at Alampur (Raichur), Hyderabad, have survived, there was no need of a separate Maṇḍapa or hall adjoining it.

PROPORTIONATE MEASUREMENT OF THE TEMPLE

The temple Hemakūṭa, the abode of Śiva and the Vidhyādhara, is here reconstructed from the Talacchanda (p. 247) and the Ūrdhvacchanda given in ch. LVII. 50-86, and translated below.

Prāsāda Hemakūṭa (S.S. LVII. 50-86).

“In a square field, (each side) being divided into 26 parts, six of these parts are assigned to each corner (karna); the Śālā, the hall-like projection in the middle of each side, extends (āyama) over 12 parts and projects (nirgama) 3 parts on all the four sides of the square. Thence there is a further projection; it has a width of eight parts and its offset measures once more 3 parts. 4 four-sided pillars (should be there) in the four directions [these are not indicated in the drawing]. The interval between Karna, the corner portion, and the Śālā has a width (vistāra) of one part; there the vertical chase (jalāntara) has a recess (praveśa) of one part.

The angle or edge itself (koṇa) of the corner portion (karna) is assigned one part and next to it is a minor offset or lateral bay (pratyaṅga), one part wide and

projecting half a part; it is next to a further projected part (rathikā) which is two parts wide and has a projection of one (further) half part [it forms the middle buttress (bhadra) of the corner portion] and is flanked on its other side by a Pratyāṅga, equal to the first. These are the proportions in the four Kārṇas. In thickness the outer wall (bāhya bhitti) measures three parts.

The Garbha has an area of 64 parts and the wall of the Garbha is three parts thick. (Here) the Kārṇa, including the water-path, extends over three parts, the chase (vārimārga) measures one half part in width, its depth (praveśa) being one part. The Śālā, the broad, central buttress, extends over 8 parts, and has a projection of half a part. Thence the Bhadra which has a width of four parts, projects one half part further" (verses 50-59).

The drawing of this 'rhythmic disposition' of the floor, the Talacchanda or ground plan, shows the powerful projection of the central part of the wall, while the corners are elaborated as flattened polygonal buttresses; they connect as much as they hold apart the four faces of the temple. An analysis of the rhythmical cadences of the outline is not given anywhere; it would fall into the sphere of aesthetics and could be correctly undertaken when a large number of temples would be drawn in plan and their vertical sections reconstructed.

Walls set up on this plan with bold projections and deep recesses are rich in mouldings. The lowermost part which extends to about one third of their height is the Vedibandha with its theme of horizontal mouldings of different curvature and height. Above it rises the 'pillar' (jaṅghā) or the recessed part of the wall. Then follows, as usual, the crowning portion of horizontal mouldings.

The Vedibandha is assigned a height of 7 parts, of the module, which is the width of the Prāsāda having 26 parts. The seven parts of the Vedibandha are distributed following the Ūrdhvacchanda or vertical rhythm: $\frac{1}{2} : 1\frac{1}{2} : \frac{1}{2} : 1\frac{1}{2}$ which are the respective heights of the moulding Kumbhaka, a torus; the moulding Kalaśa which has the profile of a vase, the recessed fillet Antarapatra and the roll cornice moulding Kapotāli.

The middle portion of the wall which is called Jaṅghā, after the height of the shaft of the pillar, has 10 parts; in the 5 parts of the crowning mouldings above it, the Bharāṇa portion, corresponding to the capital of the pillar, has 2 parts while the cornice moulding Mekhalā and the recessed fillet, Antarapatra, have 3 parts to themselves (S.S. LVII. 62-65). These vertical rhythms are vibrant with the tensions of the various curves of their profiles; the vertical walls, by their structure, appear as if in a continuous movement; they project and recede; thus they carry to every corner the repercussions of the impact which has placed them on the perimeter of the Prāsāda. Each facet is a world of its own, presided over by its own Regent or image. Though it is complete in itself it is not isolated, for the profile of the next facet, and more than one corner at a time, contribute, from various angles, their identical themes. Reinforced by such varied repetition, the superstructure rises from several points, in several shapes at a time. They are gathered in the ascent of the Śikhara (cf. Pls. III, XLIII, LXXI).⁴³

⁴³ The above Plates and those referred to subsequently in this chapter correspond, each in some respect to the particulars of the S.S.

The corners of the superstructure are fortified by small Śikhara of their own, the Karnaśikhara (cf. Pls. I, III, IV). In each corner a Karnaśikhara is set up with a width of 6 parts thus carrying the theme of the Karna which also is 6 parts wide, from the vertical wall below, into the superstructure. The Karnaśikhara is a replica, on a smaller scale, of the central and main Śikhara, the Mūlamañjarī. Against each of the 4 curvilinear faces of the 'Root' Mañjarī (mūla-mañjarī) and the corner Mañjaris leans an Uromañjarī; its name says that it leans on the 'chest' of its Mañjarī. An Uromañjarī is a vertical section of a Mañjarī, it is lower than the trunk of its Mañjarī having the height of its chest only, and represents a replica in the shape of an offset. Its width, on the Karna-Mañjarī, is given as 4 parts. Like its Mañjarī, it is complete with a neck (grīvā), Āmalaka and a finial consisting of Candrikā and Kalaśa. While the Karnas have their continuity in the superstructure in the Karnaśikhara, the Ālinda, the balcony or furthestmost central projection in the middle of each side, has its corresponding form in the Śukanāsā or Simhakarna, the large 'face stone' in the superstructure. Its width, like that of the Ālinda itself, is equal to the width of the Garbhagrha; its height has six parts.⁴⁴ The interval between Karna-mañjarī and the Simhakarnas is filled by minor or 'lateral' forms (pratyaṅga) carved with figures such as Kinnaras, etc. Tilakas, moreover, or Mañjaris, as small as a 'sesamum seed' (tila), and small Kūṭas are placed as lesser accents on the total volume of the Śikhara.

Above this variegated 'socle' of the superstructure rise the curves of the Mūlamañjarī; its ascent is prepared by an Uromañjarikā half of whose height lies behind the Simhakarna. It is broader than the Simhakarna so that the latter has the position of an antefix. This Uromañjarī of the main Śikhara, the Mūlamañjarī, is 12 parts wide at the base, its Skandha or shoulder course has seven parts, the parts above it are, as usual, the neck (grīvā), Aṇḍaka, Candrikā and finally an Ākāśa-liṅga, instead of a Kalaśa. Its height is given as two parts. Now the final Mañjarī emerges from its sheaths, the Uromañjaris, to a height of 21 parts from its base of 20 parts which covers the Garbhagrha with its walls (the kandabhittis) and the Andhakārikā or Bhramaṇī, the inner circumambulatory.

The root-Mañjarī has five Bhūmis, storeys or levels, of which the first is 5 parts high and each subsequent storey is lower by half a part than the preceding one. The shoulder course, Skandha, being only 12 parts broad is one part high. Above the shoulder course are the obligatory parts; the Aṇḍaka is very broad, 11 parts out of the 12 of the Skandha, and above it, slightly smaller is the Daṇḍikā, whose diameter has 9 parts; Daṇḍikā appears here as the name of the second Aṇḍa which is frequent on temples in the middle region of India of the tenth century.

Thus the Prāsāda Hemakūṭa attains its total height of 53 parts; it is one part higher than twice the 26 parts of its basic line and module.⁴⁵

The Prāsāda Vijayabhadra (S. S. LVII. 173-180) can also be reconstructed from its plan. Its Śālās, contrary to the general use are not equal to the width of the Garbhagrha, but are narrower; the vertical drain (jalāntara) supplements the

⁴⁴ Its base lies above the Karnaśikhara; in height it occupies 6 out of the 13 parts of the Uromañjarikā.

⁴⁵ Five Latās (called Pāga, in Orissa) further differentiate the Śikhara. Latā, in the S.S., designates an offset or 'buttress' of the Śikhara (LVII. 197).

required width.⁴⁶ In the plan of the Hemakūṭa, only the second Ālinda or Śālā had the width of the Garbhagrha; in this way the buttresses and recesses are balanced and based on the knowledge of an optimum proportion. In this Prāsāda

Prāsāda Vijayabhadra (S.S. LVII. 173-180).

of 28 parts, the height is given as twice the width plus two Kalās; the neck (grīvā), the Anḍa or Āmalasāraka being outside this measure.

The text gives 16 as the measurement or width of this Prāsāda. Sixteen however is the outer side of the wall of the Garbhagrha, the Antarabhitti, in this

⁴⁶ The depth of the recess of the water-course (ambumārga) and the Kandabhitti or wall of the Garbhagrha, is not given in the text, verse 179 being corrupt. It is assumed to have half a part. The ambulatory appears in the plan as 1 part wide in the middle of each side; the Śālās, however, are not massive but form balconies so that in the actual building the ambulatory is wider, in the middle of each side, than appears in the plan.

Sāndhāra-prāsāda; this is the proportionate measure of the wall of the Prāsāda proper; the length of the Bāhyabhitti, the outer wall is 28; the height of the vertical walls of the Prāsāda is given as 24, thus forming a prism lower than a cube. The height, expressed as that of the Tulā or the architrave, is composed of the Vēdibandha, the base mouldings, which occupy 7 parts; the Jaṅghā or wall proper of 12 parts, and the crowning mouldings which have 5 parts.⁴⁷

The vertical walls of a Nirandhāra Prāsāda, like the Rucaka, may be higher than the measurement of its width; in a Sāndhāra Prāsāda they may be lower.

Prāsāda Kṣitibhūṣaṇa (S.S. LVII. 760-80).

The ground plan of the Prāsāda Kṣitibhūṣaṇa (S.S. LVII. 760-80) is of particular interest. The height of the Tulā has 10 parts, two parts less than its width; its superstructure has 15 parts which are divided into five storeys; the lowermost has $3\frac{1}{2}$ parts, the second $3\frac{1}{4}$ and each successive storey is by $\frac{1}{4}$ part lower than the preceding. The height of the portion of the superstructure, above the shoulder course, is here called Śīrṣa, the head, and it measures $\frac{1}{2}$ part, so that the height of the Prāsāda Kṣitibhūṣaṇa is $25\frac{1}{2}$ parts. The Śīrṣa above the Skandha may have one of several shapes: The Prāsāda Kṣitibhūṣaṇa is one of those Prāsādas which can be built as "Drāviḍa, Nāgara or Varāṭa".⁴⁸

It is a non-committal plan; a Drāviḍa Prāsāda (Fig. on p. 257) is thus laid out, in principle; as a rule further offsets are placed between the central, main projection,

⁴⁷ The Vēdibandha here is composed of a Kumbhaka which occupies 3 parts, Masūraka $1\frac{1}{2}$, Antarapatra 1 and Mekhalā $1\frac{1}{2}$ parts. The crowning mouldings above the Jaṅghā have here a Galapaṭṭikā of 2 parts, Andhārikā $\frac{1}{2}$, Varāṇḍikā $1\frac{1}{2}$ and Antarapatra of one part.

⁴⁸ Drāviḍa, Nāgara and Varāṭa, as also Nāgara, Drāviḍa and Vesara are dealt with in a separate following chapter.

and the Kārṇas. These intervening offsets project to the same height as the Kārṇas; the outline of the plan of a square Drāviḍa-prāsāda, as a rule, is an indented square whereas the outline of the ground-plan of a Nāgara-prāsāda has much more rhythm and indefinitely many variations of it while its general tendency is towards a 'cruciform' expansion of the inner square of the wall.

Altogether the opposite to the Sāṇdhāra Prāsāda, having double walls, is the Prāsāda Nandighoṣa which is without walls altogether (S.S. LVII. 429-435). Its ground floor has 24 pillars disposed so as to form a cross of which the 4 outermost pillars on each side demarcate the space occupied by the Bhadrās in the massively built brick or stone temples; the four central pillars demarcate the place of the

Prāsāda Nandighoṣa (S.S. LVII. 429-435).

Garbhagrha and four further pillars fix the corners of this square Prāsāda. It has three storeys, the second has 16 pillars, and thus occupies the extent of the square of the Prāsāda whereas the third storey has only 4 pillars whose positions along the vertical axis coincide with the four pillars of the Garbhagrha.

The plan of this pillared Prāsāda, when translated into that of a structure with compact walls is classified under the name of Mahāghoṣa (S.S. LVII. 603-08) and is akin to the lay-out of the central part of the Gārhapatya Agni. Similarly also is the plan of the temple of Ambarnātha related to the lay-out of certain of the strata of the Agni on the Saumiki-Vedi. The rhythms by which the bricks were imbued (p. 105) are productive of the many varieties of the Talacchanda of a Hindu temple. Though it be built of wooden pillars only, their position, as in the Prāsāda Nandighoṣa, is related to those of the Bricks, the 'goddesses', of which also the walls of the temple, be they of brick or stone, are made.

The norms of proportionate measurement, given by the earlier and the later texts, unmistakably apply to the temples (type II) having a Śikhara for their super-

structure. The nomenclature of the temples, according to their superstructure is dealt with in a subsequent chapter of Part VII. South Indian texts and the chapters LXI and LXII of the 'Samarāṅgaṇasūtradhāra', which have the Drāviḍa Prāsāda for their subject, have their own norms and nomenclature.

The architectural rhythms of the Hindu temple impart to each building its consistency and wholeness. They evoke in the devotee (bhakta) an adjustment of his person to its structure; his subtle body (sūkṣma śarīra) responds to the proportions of the temple by an inner rhythmical movement. By this "aesthetic" emotion the devotee is one with the temple; and qualified to realize the presence of God.

Central Part of the Gārhapatya Agni
(Ś.B. VII. 1. 1. 18; Part II. note 19).

PROPORTIONS OF THE MAṆḌAPA

The Prāsāda at all times is the temple proper. The other structures which are combined with it are subservient to it. This is expressed in their proportions which are based on those of the Prāsāda. By proportionate measures and the theme of its walls and not only by propinquity, contiguousness or coalescence with the building of the Prāsāda is the Maṇḍapa part of the temple. At first, however, in some of the earlier temples, having a Maṇḍapa structure, it was added to the Prāsāda after the construction of the latter. The Maṇḍapa of the Paraśurāmeśvar temple in Bhuvaneśvar is the result of such an afterthought; its squat shape with its clerestory roof appears shunted on to the wall of the Prāsāda which prior to this combination had been carved in every detail. But it is not only as an afterthought, as in this particular case, that the Maṇḍapas of some of the earlier Prāsādas give no rhythmical response to the theme of the Prāsāda; they offer an unmitigated contrast. The Uttareśvar temple at Bhuvaneśvar, whose Maṇḍapa and Prāsāda were planned and set up at the same time and are contemporary with the Paraśurāmeśvar temple shows the problem which confronted the Sthapati.⁴⁹ A century or more had to pass before he arrived at the perfect solutions showing the Prāsāda as the main building and temple proper, with the Maṇḍapa as the lesser part of the sacred structure, following its rhythm in the particularities of its own form. In Orissan temples the integrity of the two buildings is more strongly retained than elsewhere, but even there one wall surrounds their continuity and only indicates their separateness by a deeper recess than any produced by the buttresses of the wall of the two structures. Within this juncture (saṃsṛti; S.S. LXVI. 17) lies the porch (antarāla) of the Prāsāda or Garbhagṛha, fulfilling the function of the Mukhamāṇḍapa of the more ancient temples. This small porch is marked on the outside of the Prāsāda (Pls. XLVIII, XLIX; cf. also Figs. on pp. 255-56) by a buttress carried on to the Śukanāsā, at the prescribed height which regulates the height of the Maṇḍapa.

The superstructure of the Maṇḍapa must not exceed in height the Śukanāsā of the Prāsāda (S.S. LXVII. 102; 110). The Śukanāsā, however, at different periods and in the various types of temples itself varies from having half the height of the Śikhara to a less 'perfect' proportion. While thus the height of the Maṇḍapa depends upon the height of the temple and its Śukanāsā, its proportion is not a fixed one; in plan however the centre of the Maṇḍapa is in a fixed proportion to the Garbhagṛha; its central square has the same area (S.S. LXVII. 43).⁵⁰ This

⁴⁹ By building instead of the 'clerestory' "dvichādyā" roof of the Jagamohan (cf. also the Vaital Deul, Bhuvaneśvar), a "trichādyā" roof as on the Jagamohan of the Siṃhanātha Temple at Baramba, Cuttack, the Jagamohan is seen to rise towards the shape it was to be given in subsequent ages, as Piṛhā Deul, having a pyramidal superstructure composed of the roofs of many storeys.

⁵⁰ In a Nirandhāra Prāsāda (Fig., p. 230A, Ambarnāth) this square is the Garbhagṛha proper. In a Sāndhāra Prāsāda (Fig., p. 255, Khajuraho) it is the Garbhagṛha with Kanda (or Antarabhitti); the area of the square in this instance is measured from the outer corners of

PROPORTIONATE MEASUREMENT OF THE TEMPLE

central space is marked as a rule by four pillars, forming a *Catuṣkī*, a pavilion, whose pillars, by underpinning, help to support the roof or dome. The intercolumnia of the central square have the maximum measurement. The other pillars

PLAN OF LAKṢMAṆA TEMPLE (954 A.D.), Khajuraho.

The complete correlation of *Prāsāda* and *Maṇḍapa* (*Mahāmaṇḍapa*) is seen by the walls of this *Sāṇdhāra* temple comprising within one rectangular space, the *Garbhagṛha* with its own or internal wall (*antara-bhitti*), porch (*antarāla*) and ambulatory, as well as the *Mahāmaṇḍapa* with its four central pillars. These lie in one line with the respective pillars of the *Antarāla* and the lateral walls of the *Garbhagṛha*; and furthermore with the pillars of the balcony of the ambulatory behind the *Garbhagṛha*, in one direction, and with the internal pillars of *Maṇḍapa* and *Ardha-Maṇḍapa* in the opposite direction.

The transepts are formed by the lateral balconies of the ambulatory (*pradakṣiṇa*) and by those of the *Mahāmaṇḍapa*. The *Talacchanda*, the rhythm of this unified plan, is akin to those of the schematic plans (pp. 250, etc.) drawn following the '*Samarāṅgaṇasūtradhāra*'.

The *Lakṣmaṇa* Temple is a '*pañcāyatana*' temple: four subsidiary shrines are placed in the corners of its high terrace; they are connected by a high stone bench with a sloped back which acts as parapet. The two small shrines near the steps face inward, the two of the back face outward, so that all the five temples open their doors to the devotee who has ascended the terrace.

The main buttresses or graded planes of the exterior of the temple are indicated in projection (cf. B. L. Dhama, op. cit. Pl. III).

the pillars, whereas in the *Nilakanṭheśvara* Temple in Udayapur (Fig., p. 256) it is to be measured from the inner corners of the pillars.

are placed at equal distances from each other, in aliquot parts, and originally, half of the intercolumnia in the centre: 64 pillars is their maximum number in the Puspaka Maṇḍapa (S.S. LXVII. 12). The significance of this number has its base in the number of squares of the Maṇḍūka-Maṇḍala.

The Maṇḍapa is either square or rectangular. It should have the width of the Prāsāda (S.S. LXVII. 98; Fig. on p. 255) or its width is equal to the height or diagonal of the Prāsāda (S.S. LXVI. 8). These are the most perfect proportions; or else it should be double—it has twice the width of the Prāsāda in the Udayapur Temple (below) or its length is $1\frac{3}{4}$ of the width of the Prāsāda.⁵¹ Any of these proportions may be chosen according to the available space (LXVII. 10) and other

PLAN OF NILAKAṆṬHEŚVARA TEMPLE (1059—1080 A.D.).

Udayapur, Gowalior (Pls. LII—III).

from Cunningham, ASR, vol. VII. Pl. VI.

The very substantial walls of this stellate Nirandhāra temple extend from its perimeter to the Garbhagṛha and Mahāmaṇḍapa, etc. as outlined in the plan. In this type of temple, the buttresses project radiately, and not axially, as usual.

⁵¹ Various intermediate proportions are specified in the S.S. LXVII. 1-4. In smaller temples, the Maṇḍapa increases in size to $2\frac{1}{4}$ and $2\frac{1}{2}$ of that of the Prāsāda.

considerations. "As is the Prāsāda, so is the Maṇḍapa in front of it." (ib. 24b). This applies to its walls and their theme.⁵²

Walls however are dispensable in the Maṇḍapa, it is then an Ākāśa-maṇḍapa (ib. 23) such as are for example the Sabhā-maṇḍapas in Gujerat; these are entirely

PLAN OF VIJAYĀLAYA COLĪŚVARA TEMPLE ON MELAMALAI (Cola period)

Nārttamalai, Pudukkottai.
From JISOA, vol. V. p. 85.

This Sāndhāra temple has a circular Garbhagṛha around the Liṅga; pillars in the ambulatory; the walls of the Maṇḍapa are without buttresses; those of the Prāsāda have the regularity which distinguishes South Indian Temples. The Temple faces west.

Six—originally seven—small shrines, each consisting of Prāsāda and Maṇḍapa are set around the main temple.

⁵² The pillars have their parts adjusted in height to the division of the perpendicular wall (Burgess-Cousens, 'Architectural Antiquities of Northern Gujarat', op. cit., p. 24. Wall and pillars are one in nature; being perpendicular supports, they have the same name (jaṅghā); pillars are carved on the walls; the wall is either pillar or offset and, but for the interior of the Garbhagṛha, where as a rule, it is plain, it scarcely answers to the term wall as understood in architecture elsewhere and also in the earlier temples.

Actual pillars on the other hand in extant medieval Hindu temples do not form part of the Prāsāda unless they support the roof of the balconies of Sāndhāra Prāsādas (Fig. on p. 255). Full pillars are an exception in the Prāsāda (Fig. on p. 257). They belong to the Maṇḍapa.

separate from the temple which comprises within its walls the Gūḍha or "closed" Maṇḍapa.

The same themes, but varied in their proportionate application, link the Maṇḍapa, built in one or the other of the 8 or 27 possible varieties, to the Prāsāda. The entrance to the Maṇḍapa may be equal in width to that of the Prāsāda, but exceeds its height by $\frac{1}{4}$, $\frac{1}{3}$ or $\frac{1}{2}$ (S.S. LXVI. 20) or it should be $1\frac{1}{2}$, $1\frac{2}{3}$, $1\frac{3}{4}$ or twice the door of the Prāsāda (S.S. LXVII. 97-98).

Within these margins of proportionate measurement the true Sthapati shows his mastermind in such temples like the one at Ambarnāth; its proportions corroborate and make use of the rules. The distance for example from the square of the Garbhagrha to the Catuskikā, the central square of the Maṇḍapa, is the diagonal of these congruous squares.⁵³ So intimately moreover are the two structures locked into one building that in this temple the centre of the Garbhagrha is the corner of the square on edge, formed by connecting the angles of the offsets of the wall of the Maṇḍapa (p. 230A).

⁵³ The division of an area marked by pillars is measured from their outer corners, as a rule.

The Maṇḍapas of South Indian temples are classified according to the number of their pillars; the 4 pillared, 12, 16, 32 and 100 pillared Maṇḍapa have each their special name and those having more than 100 pillars are known as Viśāla (I.P. IV, XXXII. 97-116; cf. Fig. on p. 257). The synonyms for pillar are: Sthāṇu, Sthūpa, Pāda, Jaṅghā, Carāṇa, Aṅghrika, Stambha, Talipa and Kampa ('Mayamata', XV. 2). The proportionate measurements of Maṇḍapa and Prāsāda, of the pillars and intercolumnia, are dealt with in the 'Īśānaśivagurudeva-paddhati', l.c.

Paṭṭikā (vājana), fillet
Gala (kaṇṭha ; antari), recess
Kampa, a half-fillet or fascia
between a
Paṭṭikā or any major mould-
ing and a recess.

(b) curvilinear :

Kapota, Padma, etc., cyma
Kumuda, torus
Kumbha, half torus and
fillet combined
Kanjika, arris.

re. further synonyms and names of other mouldings, see notes 40, 41, 47.

THE PROPORTIONS OF SOUTH INDIAN TEMPLES

The pure proportions of the earlier texts are, it has been shown, modified later. A large body of *Vāstuśāstras*, moreover, which belongs to South India, testifies to a further departure from the correspondence between the proportions of the plan and the elevation of the temple. None of the known sources of South Indian architecture is as ancient as the '*Bṛhat Saṃhitā*'.⁵⁴ In the '*Īśānaśivagurudevapaddhati*', compiled between the ninth and eleventh centuries, is the key to the complexities of the proportions of the South Indian temples. They correspond to the complex nature of these types of temples.

Size, in a South Indian temple is more than a quantity. The different classes of the South Indian temples are distinguished partly by their size which in turn is connected with the simplicity or the complexity of their types. The simplest or one storeyed small temple (*alpa-prāsāda*) has for its superstructure but another yet smaller shrine, complete with its perpendicular walls and cupola (Fig. e, on p. 185). The larger temples with many storeys show this superstructural temple raised to the top floor (Figs. f-h), 16 floors being the maximum number, whereas each one of the lower storeys has its parapet of chapels. In brief, the distinctions are not only between the Small Shrines (*alpa-prāsāda*) and the large, Main Temples (*mukhya-prāsāda*) but also and even more important, between the *Alpa-prāsādas* and the *Jāti Vimānas*. *Jāti* means not only a special class (*Jāti*) of temples; a *Jāti* temple is a 'collective temple' which carries on its perpendicular walls the various classes of the shrines of the parapet. It is their 'common denominator'.⁵⁵ The 20 Main Temples (*mukhya-prāsāda*) dedicated to Śiva, Brahmā and Viṣṇu—are foremost amongst the *Jāti Vimānas*. Second in the hierarchy of the *Jāti Vimānas* come the 32 *Jātitara Prāsādas*, dedicated to all the gods, and these are followed by the *Jāti Vimānas* of which twelve are for (worship by) *Brāhmaṇas*, 24 for *Kṣatryas* (kings) and 8 for *Vaiśyas* and *Śūdras*.

The *Alpa* or *Kṣudra-vimānas*, the small shrines, are described as having from one to three or four storeys (*Ī.P. III. Ch. XXX. 18-21 ; 54-60*). Their width ranges from 3 to 10 cubits (*hasta*). They have an inner ambulatory (*madhya-nāḍikā*) between double walls, or are with one set of walls only. In the latter instance the area of the *Garbhagṛha* has 64 squares, while in the former it has 81; by the preservation of these numbers the South Indian temples prove themselves built on the *Vāstu-maṇḍala*. The walls are relatively much thinner than in the temples of

⁵⁴ The relatively earlier datable sources as yet known are the '*Īśānaśivagurudevapaddhati*' and the '*Samarāṅgaṇasūtradhāra*'; the latter gives two chapters to the *Drāviḍa-prāsāda*, while the former deals with the architecture of the *Drāviḍa-prāsāda* only to the exclusion of other types. The '*Vaikhāṇasāgama*' is probably earlier and, on the whole, has been assigned a date not later than the eighth century A.D. Its author is Marīci; the architectural terms (*śikhara*, etc.) have their definite South Indian connotation.—The '*Kāmikāgama*' appears to be later than the '*Īśānaśivagurudevapaddhati*' or of the same age.

⁵⁵ The rendering of the architectural term '*Jāti Prāsāda*' as 'collective temple' is based on the meaning of *Jāti*: "reduction of fractions to a common denominator".

Chart I. Instead of having a thickness of $\frac{1}{4}$ to $\frac{1}{6}$ th of the width of the Prāsāda or of the Mūlasūtra they are assigned an eighth, ninth or tenth part only; or in a Sāndhāra shrine, the thickness of the outer wall is $\frac{1}{8}$ th of the width of the Prāsāda, that of the inner wall $\frac{1}{6}$ th of the Garbhagrha ('Śilparatna', XX, 1-3). The proportions of the plan thus form a geometrical series when there are double walls; they form no series at all in the temple without ambulatory; which judging from the proportions of its plan is an afterthought introduced for the sake of the completeness of the 'small temple'.

The vertical proportions are meted out with reference to the height. It is a principle of the South Indian proportions that the total height of the temple is subdivided into a certain number of parts; each of these again is subdivided; the latter divisions are not directly referable to the division of the ground plan although the height itself is expressed in terms of the Mānasūtra.⁵⁶

The height is twice the width of an Alpa Prāsāda; being divided into 8 parts, four are assigned to the perpendicular walls and 4 to the superstructure; each of these main divisions of the Small Temple is subdivided three-fold, the perpendicular wall into its socle (adhiṣṭhāna), 'pillar' or wall surface proper (stambha) and entablature (prastara); the superstructure of the one-storeyed Alpa-prāsāda analogously has the following three parts: its Neck (kaṇṭha); the Śikhara; and the Stūpi, above the Śikhara.⁵⁷ These 6 portions follow in the vertical direction the rhythm 1:2:1; 1:2:1, this is how the 8 parts of the height are meted out.

⁵⁶ This applies also to the proportions of the wall or pillar and door. Their total height is commensurate to their width.

The pillar is higher than the door by $\frac{1}{7}$ th, $\frac{1}{8}$ th or $\frac{1}{9}$ th of its own height and the width of the door remains, as in the earliest texts, half of its own height ('Śilparatna' XXII. 3). See note 10, Part VII.

⁵⁷ The (solid) dome shaped roof or cupola is called Śikhara in South Indian Vāstusāstra (I.P. IV. XXXII. 67-68). Eight kinds of Śikharas are distinguished according to their section (śiraśchanda) or 'plan': square, rectangular, circular, elliptical, of Sālā-shape, the 6 sided, the 8 sided and the 16 sided ('caturaśra, āyatāśra, vṛtta, vṛttāyata, śālākāra, ṣaḍaśra, aṣṭaśra, ṣoḍaśaśra'). These Śikharas, moreover, fall into seven different classes according to their relative height. The names of these seven classes are: Kālīṅga, Kāśya, Vārāṭa, Ullaka, Saundika, Kāśmīra and Gāṅgeya (verse 71).

The 'Mayamata', XVIII. 8-10, too knows 8 classes of these Śikharas and gives the proportionate height as $\frac{2}{5}$, $\frac{3}{7}$, $\frac{4}{9}$, $\frac{5}{11}$, $\frac{6}{13}$, $\frac{7}{15}$, $\frac{8}{17}$, and $\frac{1}{2}$ of the width of the chapel. Kaṇṭha (neck) stands for 'bhitti', the wall of each; the generally accepted height of the cupola or Śikhara being $\frac{1}{2}$ of the width of the chapel.

The respective names of the 8 classes are in the 'Mayamata': Pāñcāla, Vaideha, Māgadha, Kaurava, Kausala, Saurasena, Gāndhāra and Āvantika. These, however, are names of the Lupās (rafters) in the I.P.; whereas the names of the eight classes of the Lupās in the 'Mayamata' are: 'Vyāmiśra, Kālīṅga, Kauśika, Vārāṭa, Drāviḍa, Barbara, Kollaka and Saundika (XVIII. 13-14).

These names refer to countries and seem to suggest that the various proportions of the dome originated in the various parts of India. Their series however are interchanged in the two texts, with those of the rafters (lupā). The name Vārāṭa is common to both the texts, Drāviḍa occurs in the 'Mayamata' only. The various proportionate heights from $\frac{2}{5}$ to $\frac{1}{2}$ are named after regions of India from Kashmir in the North-west to Kālīṅga (Orissa) in the East. Vārāṭa (Berar) as the name of a region is familiar to Vāstusāstra. The naming and classification of certain properties of the dome-shape after various parts of India is a characteristic of South Indian texts; cf. chapter on 'Nāgara, Drāviḍa, Vesara'.

PROPORTIONATE MEASUREMENT OF THE TEMPLE

The triple sub-division is absent from the majority of the proportions of Chart I. The socle there is not specifically assigned a definite height.⁵⁸

The triple division of the perpendicular portion is necessary in view of the special kind of superstructure which is a complete shrine; its walls now form the neck (grīvā) of the Śikhara, its dome shaped roof, on which is placed the finial (stūpi).

Alpa-Vimāna acc. to 'Īśānaśivagurudevapaddhati'

Pt. III. ch. XXX. 54-59.

		A without ambulatory	B with ambulatory
Proportions of the Plan	Width of the Vimāna (mānasūtra)	W=10x	W=9x
	Width of the Garbhagrha ...	4/5W=8x	W/3=3x
	Thickness of wall ...	W/10= x	W/9= x
	Thickness of outer wall ...		do.
	Width of ambulatory (madhyānādikā) ...		do.
Proportionate Vertical measures	Height of socle (adhiṣṭhāna) ...	W/4=5x/2	W/4=9x/4
	Pillar (stambha) or wall ...	W/2=5x	W/2=9x/2
	Entablature (prastara) ...	W/4=5x/2	W/4=9x/4
	Neck (kaṇṭha) ...	W/4	W/4
	Śikhara ...	W/2	W/2
	Stūpi ...	W/4	W/4
Height of Vimāna		2W=20x	2W=18x
			8 parts

According to their size, there are 3 varieties of 'small shrines'. The foremost has indeed a height twice its width, whereas the height of the lesser varieties is given as $1\frac{6}{7}W$ or $1\frac{1}{2}W$ for the mean and the least kind (verses 52-53, ib.).

The width of the Garbhagrha in a one storeyed temple is given in the 'Vaikhānasāgama' as $\frac{3}{5}$, $\frac{4}{7}$, $\frac{5}{9}$, $\frac{6}{11}$, $\frac{7}{13}$, $\frac{8}{15}$ or $\frac{9}{17}$ of the width of the Prāsāda. The 'Kāśyapaśilpa', XXVII, adds $\frac{1}{3}$ or $\frac{1}{2}$ to these possible proportions (slightly modified) and the 'Mānasāra' also follows them closely.

Śikhara is the name of the dome shape, whether it crowns the High Temple (Harṁya) of the Alpa-Vimāna, Jāti-Vimāna, or of any of the Anukāya-aṅgas (kūṭa, koṣṭha, etc.) of the latter. The 'Mayamata', XVIII. 16 enumerates, in addition to the shapes of the cupola in the I.P., the following: the 12 sided; the ripe Āmalaka shape; the lotus bud shape, and the globular dome. Cf. also 'Śilparatna', XXXII. 1-17, for further specifications about the proportionate height of the Śikhara.

⁵⁸ In Orissa, Pābhāga is the name of the lowermost zone of the wall (vedikā) with its horizontal mouldings; they have their specific names ('kumbha, kalaśa', etc.); also in the temples of Gujarat. Pābhāga, Jaṅghā and Baraṇḍi ('Canons of Orissan Architecture', op. cit. pp. 98-99), in the Orissan temple correspond in their proportions to those of the Adhiṣṭhāna, Stambha and Prastara of the South Indian Alpa-prāsāda. With the addition of the Pīṭha, the actual socle, in an Orissan temple, however, the proportion changes from 1:2:1 to 2:2:1. Re. the Pīṭha and Vedibandha, the socle and the series of mouldings at the bottom of the wall, see notes 40 and 41.

The level of the floor of the Adhiṣṭhāna is either where the Jaṅghā starts from or at a lower level where the mouldings of the Prati are: (cf. Mallayya, Studies, op. cit., JAU., X. p. 113; commenting on T.S. I. 11. 17). This would be suitable in an Alpa-prāsāda.

THE HINDU TEMPLE

The ideal height and proportions of an Alpa-prāsāda are given in the 'Īśānaśivagurudevapaddhati'. The modifications of these perfect proportions are also classified. Five possible kinds of proportionate measurement are generally admitted in the South Indian texts. The height of the temple is divided into a certain number of parts and these are assigned to the base, wall and entablature, and to the three parts of the High Temple or the superstructure. In Alpa-prāsādas, the height is divided into 6 or 8 parts, but also into 9, 10, 11 or 12 parts;⁵⁹ these are variously assigned to the four or six main horizontal divisions of the temple; each variety is given a name of its own, as shown in the chart below. A divergence from the perfect type, "at peace" in its proportions (Śāntika), is, it appears, the rule. The superstructure, moreover, in three out of the five varieties exceeds in height the lower 'half' of the building.

The vertical proportions of one-storeyed South Indian Temples or Alpa-Vimānas, acc. to 'Vaikhānasāgama', VI.

Number of equal divisions of the height	The Peaceful : Śāntika		The Successful : Pauṣṭika	The Joygiver : Jayada	The Supernatural : Adbhuta	The All-Desired : Sarvakāmika
	6	8	9	10	11	12
	$H=1\frac{3}{7}W$		$H=1\frac{1}{2}W$	$H=1\frac{3}{4}W$	$H=2W$	$H=2\frac{1}{2}W$
Adhiṣṭhāna ...	1	1	1	1	$1\frac{1}{4}$	$1\frac{1}{4}$
Stambha ...	2	2	$2\frac{1}{2}$	$2\frac{1}{2}$	$2\frac{1}{2}$	$2\frac{1}{2}$
Prastara ...		1	1	1	1	$1\frac{1}{4}$
Kaṇṭha ...		1	$1\frac{1}{4}$	$1\frac{1}{2}$	$1\frac{1}{2}$	$2\frac{3}{4}$
Śikhara ...	2	2	$2\frac{3}{4}$	3	$3\frac{1}{2}$	$2\frac{3}{4}$
Stūpi ...	1	1	1	1	$1\frac{1}{4}$	1
Vargas ⁶⁰ ...	4	6				

The 'Vaikhānasāgama' allows from $1\frac{3}{7}$ to $2\frac{1}{2}$ the width as the height of the Prāsāda. The height of a South Indian temple does not, as a rule, exceed the double of the width of the Prāsāda: this refers to small shrines whereas in large temples the height, as a rule, is $1\frac{3}{7}$ only of the Mānasūtra ('Īśānaśivagurudevapaddhati') or it is equal to the diagonal of the square of the Mānasūtra. The latter proportion is given in the 'Samarāṅgaṇasūtradhāra'.

⁵⁹ The height is subdivided in each of the above classes in a certain number of parts. The number of these divisions is the greater the more storeys the Prāsāda has.

⁶⁰ Instead of the—in a Drāviḍa building ('Kāmikāgama', XLIX. 13)—usual six major sections (varga) the 'least' shrines have only four sections (varga).—The ratios ('Kāmikāgama', ch. XLIX, 80-88), differ considerably from those of the 'Vaikhānasāgama'.

In later Vāstu-śāstras, the proportions remain basically the same but further variations are conceded. The 'Kāśyapaśilpa', XXVII, 14 f, divides the height either into 8, 9 and 10 or also into 7, 15 and 16 equal parts and has three different proportions when the height is divided into 9 parts. Two of these are: 1, $2\frac{1}{2}$, 1, $1\frac{1}{4}$, $2\frac{1}{4}$, 1;—as also in the 'Vaikhānasāgama',—and the other: 1, 2, 1, $1\frac{1}{2}$, $2\frac{1}{2}$, 1.

The 'Mānasāra' XIX, also divides the height into 8, 10 and 12 parts, but also into 14, 16 and 32 parts.

PROPORTIONATE MEASUREMENT OF THE TEMPLE

The generally five-fold classification of the South Indian temples according to their proportionate height applies not only to the Alpa-prāsādas, but also to the Jāti (and Mukhya) Vimānas. While the height of the largest temples (Mukhya Prāsāda) is generally $1\frac{3}{7}$ parts of its width or equal to the diagonal of the square (kṣetra) of the Prāsāda, there are several further variations, and their nomenclature is not always the same in the different texts of which some are listed below.

The Proportion of Height and Width of a Drāviḍa Temple.

	Vaikhānas- āgama VI.	Iśanaśiva- gurudeva- paddhati, IV. XXXI.	Samarāṅ- gaṇasūtra- dhāra.	Mayamata XI. 8-9.	Kāśyapaśilpa XXIV. 5-6.	Mānasāra XXXV. 21-25.	Silparatna XVI. 7-9. Mayamata XIX. 2.
Śāntika ...	H = 1 3/7W	H = 1 3/7W	H = W√2	1 3/7	1 4/5	H = W	1 3/7
Pañṣṭika ...	H = 1 1/2W	H = 1 5/7W		1 3/6	1 5/6	H = 1 1/4W	1 1/2
Jayada ...	H = 1 3/4W	H = 1 6/7W		1 3/5	1 6/7	H = 1 1/2W	1 3/4
Sarvakāmika ...	H = 2 1/7W			1 3/4	2 1/8	H = 1 3/4W	W
Adbhuta ...	H = 2W	H = 2W		2W	2W	H = 2 W	2W
Abhicāra ...							3/4W

The Jāti-Vimānas too, can be relatively small temples, their width ranging from 7 to 23 Hastas; (Ī.P. III. Ch. XXX. 13-14). They are however more than double the size of the Kṣudra or Alpa-prāsāda : these measure from 3 to 10 Hastas only.

Jāti-Vimānas are those which have for their parapet and later for their 'enrichment' or completeness only, a row consisting of various miniature shrines, surrounding, as a rule, each of their several storeys. The fully evolved South Indian temple may best be designated as "Jāti" or "Collective" Vimāna; the Mukhya Prāsāda comprises the largest temples; they too are Jāti-Vimānas in their composition (Fig. h; Part VI).

The Jāti Vimānas, as a rule, top the list of four classes of temples, called Jāti, Chanda, Vikalpa and Ābhāsa.⁶¹ These four classes differ in the selection and the

⁶¹ The Ī.P., III. ch. XXX. 1-18, assigns a definite number of storeys and width to each class :

	Storeys	Width in hastas
Jāti - Vimāna	3—12	15—70 or also 7—23
Chanda ,,	5—12	17—63
Vikalpa ,,	5—12	13—55
Ābhāsa ,,	4—12	11—47
Mukhya Prāsāda	3—12	13—68
Alpa Vimāna	1—4	3—10

arrangement of the miniature chapels and they are also prescribed to be each of definite height. These distinctions however are secondary, all the four classes being Jāti Vimānas in principle.

The height of the Collective or Jāti Vimānas (Sarvajāti) is severally given as twice the width whereas the Main (Mukhya) temples differ from the Jāti Vimānas inasmuch as their height is only $1\frac{3}{7}$ of their respective width. The largest of these Main temples (Mukhya-prāsāda) in its maximum width has 70 hastas; the height of this 12 storeyed temple is 100 cubits.⁶²

The Jāti-Prāsāda has its plan laid out with the help of the Māna and Vinyāsa-sūtras. Along the Mānasūtra, the width of the Garbhagrha measures from $\frac{1}{3}$ to $\frac{1}{2}$ and more of the width of the Prāsāda. On the Vinyāsa-sūtras and to the Paryanta-sūtra the various buttresses project evenly and but little; only the central pier steps forth more boldly; the perpendicular walls of the Prāsāda, the prism or 'cube' which they form, is not impaired by these offsets; the many varied patterns of the plan and of the rhythms of the wall to which the northern Indian method led, are not part of the severe stereometry of the South Indian structure. (Fig. h on p. 187 and Fig., p. 257).

The buttresses of the Jāti-prāsāda are named after the respective miniature shrines (Kūṭa, Koṣṭha, Pañjara, etc.) placed above them in the superstructure of the temple. Buttress and recess (salilāntara; harāntara) alternate and never does one offset project from another; the stereometry of the South Indian temple, its nearness to the 'cube' and the pyramid, are maintained by the discipline of these its 'lesser limbs' (anukāya).⁶³

The method of proportionate measurement of the South Indian Prāsāda comprises : A, (1) the proportions along the Mānasūtra, or the co-ordinates, (2) those between the Vinyāsa-sūtras in the first or ground floor and (3) in each of the subsequent storeys; all of these referring to the Talacchanda, or the rhythms of the floor and : B, the height which is divided into a certain number of parts. The 4-storeyed temple may be taken as representative of the method which also applies to the most ambitious, the 16 storeyed temple, whose width (mānasūtra) is divided into 34 and whose height is divided into 202 parts.

A one storeyed building, however, should have a width of 3, 5, 7, or 9 hastas. A two-storeyed building of 12 or 13 hastas and a three storeyed building of 15 or 17 hastas. With every storey above that, the width of the building should be increased by 5 hastas (III. XXX. 49-52). This is the general rule.

The difference between Jāti, Chanda, Vikalpa and Ābhāsa in the selection and arrangement of the miniature shrines Kūṭa, Koṣṭha, Pañjara, etc., is formulated in Ī.P. The 'Kāmikāgama', XLV. 7 ; 19-20 ; etc.; 'Mayamata', XXII. 77 f. Jāti, Chanda, etc., in the 'Mānāsara', XI. 103-4 ; XXX. 174-5, etc., do not refer to the varieties of architectural shapes but denote various measurements only.

⁶² 68 Hastas is the mean width of this largest Mukhya Prāsāda.

⁶³ The graded planes of the perimeter, of the temples to the north of the Drāviḍa country, are unknown there. In South India, a stereometric architectural body carries representational sculptures, whereas the other temples show a gradual conversion of monumental sculpture into its carved surfaces.

PROPORTIONATE MEASUREMENT OF THE TEMPLE

A. "Rhythm of the Floors" of a 4 storeyed South Indian Temple according to 'Kāśyapaśilpa', XXX.⁶⁴

I. According to a division of the co-ordinates of the ground floor :

I. Mānasūtra	.. 12	Garbhagrha	.. 6	Gṛhapīṇḍi*	.. 1	Ālinda*	.. 1	Hara ⁶⁵	.. 1
--------------	-------	------------	------	------------	------	---------	------	--------------------	------

II. According to a division of the sides of each floor : by Vinyāsaśūtras :

1st Floor	.. 8	Karnakūṭa*	.. 1	Pañjara*	.. 1	Koṣṭha	.. 2	Harāntara* : the rest	
2nd Floor	.. 8	"	.. 1	"	.. 1	"	.. 2	"	"
3rd Floor	.. 6	"	.. 1	"	.. 1	"	.. 1	"	"
4th Floor	.. 3								

The Mānasūtra, i.e. the co-ordinates of the square plan of the Prāsāda being divided here into 12 parts, the width of the Garbhagrha is half of it, or 6 parts, its wall (gṛhapīṇḍi) has a thickness of one part; this is also the width of the inner ambulatory (ālinda); the outer wall (hara) has also a thickness of one part.

The width of the Prāsāda is thus 12 parts; for the purpose of allotting to the piers or buttresses their proportionate part of the width of the Prāsāda the latter is now divided by the Vinyāsaśūtras into 8 parts of which the buttress at the corner occupies 1 part, the 2nd buttress also 1 part and the one in the middle of the building has 2 parts. Their names are those of the type of the chapel of the superstructure; placed on top of each pier respectively; the Karnakūṭa at the corner, etc. (cf. Fig. h where however further elaborations of the Anukāyas are to be seen).

The reduction in width of the floors (bhūmi) of the superstructure is given by means of the Vinyāsaśūtras.

Similarly, the successive floors of the temples with a larger number of storeys are divided each into equal parts decreasing for example, by one part in a 10-storeyed temple, from 14 parts of the ground floor to 3 parts of the top floor; and by 2 parts in a 16 storeyed building, from 32 parts of the ground floor to 4 parts of the sixteenth floor.

⁶⁴ Vocabulary: Gṛha-pīṇḍi, Ālinda and Hara are 'enclosures' of the Garbhagrha; their width is given. They correspond to the inner wall, ambulatory and outer wall respectively. Karnakūṭa is the Kūṭa near the corner, the chapel with a square plan. Pañjara is another kind of chapel; Harāntara are the recesses intervening between the chapels; Koṣṭha is the rectangular chapel in the centre.

Adhiṣṭhāna and Tala are synonyms for socle or base; Mañca and Prastara for entablature which here combines the role of 'socle' of the higher floor and 'entablature' of the lower floor; Carāṇa and Talipa for pillar; Kanṭha and Gala for neck; Śirṣaka and Śikhara for cupola and Stūpi as well as Śikhā for finial. The Paryanta-sūtra is not explicitly given in the 'Kāśyapaśilpa'.

⁶⁵ The asterisk indicates that the respective parts of the building are symmetrical and have to be counted twice—the Gṛhapīṇḍi, etc.—to either side of the Garbhagrha; the Karnakūṭa, etc. to either side of the Koṣṭha. The numbers given against each length are those of the parts into which the Mānasūtra is divided.

THE HINDU TEMPLE

B. "Rhythms of the Elevation" of a 4 storeyed South Indian Temple.⁶⁶ acc. to 'Kāśyapaśilpa'.

		Sāntika Prāsāda Height : 39 parts		Paṇṭika : H : 42 parts	Jayada : H : 50 parts	Adbhuta : H : 50 parts	Sarva- kāṁika : H : 50 parts
Ground floor	Adhiṣṭhāna ..	2½	Tala ..	3	3½	3½	3½
	Pillar ..	5		6	7	7	7

The Finial ..	Stūpi ..	2		2	1½	2½	1

Whereas, it has been stated already, the height of the Great Temples is $1\frac{3}{7}$ of their width in the 'Īśānaśivagurudevapaddhati', it is the diagonal (karna) of the square of the plan in the 'Samarāṅgaṇasūtradhāra' (LXII. 1) where the various Bhūmis are expressed as parts of the height or the diagonal (S.S. LXII. 207. 212). The several storeys are divided into horizontal strata (stara). In a seven-storeyed temple for example, each storey having (a) its socle (pīṭha) or the corresponding lower part of the wall (vedi); (b) its pillar or wall space proper (jaṅghā); and (c) entablature parapet (kūṭaprastara), the respective height of each of the seven storeys is $9\frac{1}{2}$, $7\frac{1}{2}$, $6\frac{1}{2}$, $5\frac{3}{4}$, $4\frac{1}{4}$, 4, 3, successively to which are added the cornice of the shoulder course (kapota), etc.; and the 'bell' (ghaṇṭā) or dome-shape, etc. The width of the seven-storeyed temple is given as 35 Hastas.

Vertical Proportions of a 7 Storeyed Temple according to 'Samarāṅgaṇasūtradhāra', LXII. 183-191.

First Floor :	Pīṭha	3	Hastas
	Jaṅghā	5	"
	Kūṭaprastara	1½	"
Second Floor :	Vedikābandha	2	"
	2nd Jaṅghā	4	"
	Kūṭaprastara	1½	"
Third Floor :	Vedi	1½	"
	3rd Jaṅghā	3½	"
	Kūṭaprastara	1½	"

⁶⁶ The further sets of rhythms with the Māna and Paryantasūtra, each of 10 or 9 parts respectively, are given in XXX. 36 f.

PROPORTIONATE MEASUREMENT OF THE TEMPLE

	Kūṭaprastara	1	„
	Kapota	3	„
	Ghaṇṭā with Padma and Śirṣa	5½	„

The Total Height is 49 Hastas

In a Prāsāda with the maximum number of 12 storeys their decrease in height is however differently spaced and this holds good also for each of the Prāsādas with a different number of storeys. The width of a 12 storeyed temple being given as 67 Hastas in the 'Samarāṅgaṇasūtradhāra' its height is given as 95 Hastas, of which the successive storeys have 14, 11, 10½, 10, 8½, 7½, 7, 6, 5, 4, 3, and 2½ Hastas; and the High Temple with its cupola or Śikhara—here called Ghaṇṭā, the bell shape—with a height of 2 and 4 Hastas respectively make up the approximate length of the diagonal of the square of the Prāsāda, which is 67 Hastas wide. The successive decrease of these pragmatic proportions does not yield any series.

Gaṇya-māna, the proportionate vertical measurement of the height of the temple and of its component parts ('Mānasāra', XXVII. 35) is elaborated in South Indian Vāstuśāstras. The several component parts, analogous to the height of the temple, are subdivided each into a number of sub-sections, strata or mouldings; entire chapters, in the various texts, treat for example of the sub-divisions and proportions of the Ādyaṅgā, the socle (adhiṣṭhāna) only. Whereas eight varieties of the socle, according to its profiles and their proportions, are recorded in the 'Vaikhānasāgama', VI, five varieties only are given in the 'Samarāṅgaṇasūtradhāra', LXI, fourteen varieties are described in the 'Mayamata' XIV. 38, and 'Śilparatna', XIX. 1, twenty-two in the 'Kāśyapaśilpa' and sixty-four different kinds of Adhiṣṭhāna under 19 classes in the 'Mānasāra', XIV. 10-372.⁶⁷ When

⁶⁷ The chronological sequence of South Indian Vāstuśāstras is approximately: 'Vaikhānasāgama', 'Mayamata', 'Īśānaśivagurudevapaddhati', 'Kāmikāgama' (note 54). The 'Tantrasamuccaya' belongs to the early part of the 15th century (Mallayya, op. cit. JAU. vol XII. No. 1. p. ii).

While the 'Kāśyapaśilpa' = 'Amśumadbhedha' of Kāśyapa and 'Prayogamañjarī' are prior to the 15th century (ib. p. III), the 'Śilparatna' dates from the later part of the 16th century.

The 'Mānasāra' has been assigned, by P. K. Acharya, a place close to the 'Bṛhat Saṃhitā' and 'Matsyapurāṇa' ('Architecture of Mānasāra', p. LIX, LVIII). The 'Mānasāra' has

the great Vimānas of South India were built meticulous 'case-laws' of the many possible proportions based on the norm were classified in Vāstu-śāstra.

nothing in common with these treatises on the science of architecture and represents a different school, i.e. that of South India exclusively.

The word 'Mānasāra' is also not to be found in the 'Agnipurāṇa', where the Āmalasāraka has been mistaken by P. K. Acharya and rendered as 'Mānasāra'; cf. A. P. ch. LXI; note 40 and chart I.

Amongst South Indian text books the 'Mānasāra' stands relatively nearest to Kāśyapa's treatise which, being referred to in the 'Tantrasamuccaya', belongs to an age prior to the 15th century. The 'Mānasāra', moreover, frequently, though summarily, speaks of Buddha and Jina temples and images. This would indicate that these religions must have had adherents in S. India not very long before the compilation of the 'Mānasāra'; it may be assigned to the Pāṇḍya age when high Vimānas were still erected and necessitated the detailed measurements given in the 'Mānasāra'.

Most of the sources used in the present context have been published; a few only have been translated ('Mānasāra' and parts of 'Tantrasamuccaya' and 'Vāstu-vidyā'). Relevant passages from unpublished texts are given in the Appendix.

About four hundred manuscripts on Vāstu-śāstra, as yet not published, are said to exist.

Alternative figures in the various texts are indicated by the sign which denotes the respective passage, for example, 'Matsya Purāṇa'. The descriptions of the Br. S. however are valid also in the other texts where no alternative statement is tabulated. The chart shows most, though not all the figures, given in the texts.
** Refers to V.P. where it differs from M.P.

II. VARIETIES OF THE TEMPLE AND THEIR GENESIS

A. THE "TWENTY TEMPLES"

The description of the Twenty Temples in the 'Bṛhat Saṃhitā', LV, follows immediately the rules of proportionate measurement. They apply to each of the twenty varieties tabulated in Chart II. The same names and descriptions are also given in the 'Viśvakarmaprakāśa', 'Matsya Purāṇa' and other Purāṇas and in the chapter on Nāgara-prāsādas in the 'Samarāṅgaṇasūtradhāra' (LXIII. 1-34). The same varieties were thus considered as representative of the Hindu temples by the middle of the sixth century and about half a millennium later. But there is a difference; for the Twenty Temples are described not only once in the 'Samarāṅgaṇasūtradhāra' and somewhat summarily; they are also dealt with in some of their 'subtle' details (sūkṣma lakṣaṇa) in the selfsame text, in Chapter LVII. 641 f. and in Ch. LIX where some of them are seen to represent, amongst other temples, a particular local school, that of Mālava.

The first three names in the 'Bṛhat Saṃhitā', Meru, Mandara and Kailāsa, which are those of the Mountain denote the largest temples; they have also the greatest number of storeys or Bhūmis; another temple, Nandana, is equally high, but has 6 Bhūmis only. These four varieties and a fifth, called Vimānacchanda, form the first and most important group. They have all one and the same shape in plan; this is expressed by the specification that each has six Aśras (ṣaḍaśra). Aśra means here apparently a side or face and not an angle; the ground plan of these temples is not hexagonal but it has six faces, for each of its three sides has a central buttress which is set off from the wall, its face running parallel to that of the wall; the fourth side, where the entrance is, has no such buttress; a porch (prāgrīva) or a Maṇḍapa protects it. Although this side is the entrance side, and generally faces East (prācī) it is not the façade of the temple; the temple strictly speaking has no façade, it faces the four directions; as a monument all its sides contribute equally to its form and meaning. The ground plan of the first group of temples thus is a square, the middle of each face projecting from the total length of that side.⁶⁸ Viewed by an author of the sixth century this shape was evolved

⁶⁸ No hexagonal temples are preserved but this would not be sufficient reason for assuming that hexagonal temples did not exist; no elliptical temples (āyatavṛtta) are in existence either; yet they figure largely in Vāstuśāstra. The usual word for hexagon however is ṣaḍkoṇa.

The specific use of the terms in Vāstu-śāstra has to be reconstructed from the meaning of the passages in which they occur, a comparison with other passages where either the same terms are used or else the same meaning is given though different terms may be employed, and by testing the meaning with the help of actual buildings.

Ṣaḍaśra, however, in the 'Śilparatna', XXXVIII. 15, means hexagon. This text, one millennium approximately later than the 'Bṛhat Saṃhitā', was compiled by Śrikumāra of Kerala in the latter part of the sixteenth Century and deals with the South Indian types (IB)

but recently; it had the greatest importance at the time when the 'Bṛhat Saṃhitā' was compiled. The plain straight walls of the dolmen had preceded it. This is why the description 'ṣaḍaśra' heads the list of the varieties of temples in the 'Bṛhat Saṃhitā' and disappears from later lists when the central face (aśra) or offset on each side had consolidated as the main buttress (bhadra) in the architecture and terminology of the Hindu temple.

Others of the Twenty Temples are circular, or else the walls have 8 or 16 bays which make a cusped ground plan; it is likened to the petals of a lotus flower. Another plan is likened to the bird Garuḍa; the temple Garuḍa as described in the 'Viṣṇudharmottara', III. Ch. LXXXVI. 60, might have been its shape (see Appendix). The different shapes of the temple carry suggestive names, one of them being Kuñjara or Gaja, elephant, its shape at the back being that of the posterior of an elephant (hastiprṣṭha) might have been apsidal.

The four Prāsādas, enumerated at the end of the list, forgoing all metaphor, convey the geometrical form of their plan by their names: they are the round, the square, the sixteen and eight sided one (Vṛtta or Vartula, Caturaśra or Catuṣkoṇa, etc.). These straightforward names however imply a particular configuration of the temple. No light should enter it; walls are built all round, the image in the Garbhagrha is of jewels, an embodiment of superluminous darkness. The entrance is from the West so that only the rays of the setting sun can enter the dark passage around the walls of the Prāsāda. It is this meaning expressed by the commentary which is implied in the temple plan. Square or circular, eight or sixteen sided, the Prāsāda has two walls and a dark passage between them. The outer wall is not carried up to the full height of the Prāsāda, it is 'cut' (cheda), ends at a lower level than and is connected with the main building within it, by a roof (Br. S. LV. 28, Comm.).⁶⁹

of temples only. The hexagonal type is enumerated as the second but last of seven types of 'shapes' of the temple. The first type is Caturaśra, the "four-sided".

It seems improbable that the 'Bṛhatsaṃhitā' would give the first place to hexagonal temples, in five varieties of which the first and foremost is Meru; Meru, in the 'Matsya' and 'Vāyu Purāṇas' is described as four sided (caturaśra).

The temple called Viṣṇucchanda (type IB) of the 'Īśānaśivagurudevapaddhati', Part III. Ch. XXVIII. 113-115, has a hexagonal Garbhagrha and cupola (śikhara). A small temple at Toka on the Godavari is described as having a six pointed star for its plan (J. Burgess, 'Report on the Antiquities in the Bidar and Aurangabad District', ASWI, vol. III. p.21). The temple type, recorded in the eleventh century, in the I.P. is one in a list of 20 temples of South Indian type; it belongs to a different tradition than the Twenty temples of the Bṛhatsaṃhitā, and the other Vāstu-Śāstras given in Charts I and II.

Aṣṭāśra however denotes an octagon; it forms the ground plan of the Muṇḍeśvarī temple at Bhabua, Arrah, built before 634 A.D. (ASI. NIS LI. p.143; R.D. Banerji, 'History of Orissa', II. Pl. facing p.240) and also of the Śaṅkarācārya Temple at Śrīnagar of the eighth century (ASIAR, 1915-16, Pl. XLIV). Nonetheless 'aṣṭāśrī' in the 'Bhuvanapradīpa' N. K. Bose, op. cit. p. 125, denotes a Navaratha Temple; having four Rathas on either side of the Bhadra. Similarly we are compelled to consider the Ṣaḍaśra not as a hexagon, but as a square with Bhadras or offsets in the middle of each side. Aṣṭāśra, however, admitting either explanation, appears to mean an octagon in the classification of the texts. The Ṣaḍaśra being a special form of the Caturaśra is omitted from all the later classifications.

⁶⁹ A similar construction can best be seen in the temple at Gop, Kathiawar; also in Central India at Bhumara and Nachna Kuthara, and in the Deccan at Bādāmī; these temples however have a superstructure above the ground floor.

The last named temples have each one storey or Bhūmi only. The remaining of the Twenty Temples have either one Bhūmi only, or else, any number from five to twelve Bhūmis. The height of the temple is not necessarily given by the number of Bhūmis. The temple Meru has the greatest height, 64 Hastas or 96 feet—it is not advisable say the texts that a building should exceed 100 Hastas in height.⁷⁰ 64 Hastas is also the height of the temple Nandana, but the former has 12 Bhūmis and the latter only six.

The height of 14 of the 20 Temples in the Br. S. is double their width. Following other norms the height is thrice the width of the temple. Śikhara designates the tapering superstructure; Śṛṅga also, but it is without storeys (bhūmi; 'Viṣṇudharmottara', LXXXVI. 13). Anḍa is another name for Āmalaka (cf. S.S. LVII. 110; 234, etc.). The number of Anḍas is one where there is one pointed Śṛṅga. Where however the storeys are many, in the temple Nandin, or the Śikharas, of the temple Sarvatobhadra, or the roof is of a different shape the number of Anḍas is many; several such devices supported a row of finials, similar to those of the keel-shaped roof of the Bhīma Ratha at Mamallapuram, where their number is eighteen.

The 'four sided' temple moreover is described as having 5 Anḍas; one crowns the high Śikhara; and clinging to each of its sides is a lesser Śikhara each with its Anḍa. Each Śikhara or Śṛṅga carries above its crown a Kalaśa or jar of the nectar of deathlessness.⁷¹ The lateral Śikharas, later texts designate as Uromañjarī. They face the four directions.

This was also originally a function of the four doors which are explicitly prescribed for the temples Meru and Sarvatobhadra; in extant temples, the niche (ghanadvāra) in the centre of each wall corresponds to the original door (dvāra). The temple with a door in the four directions, and the shrine with double walls full of darkness, and one door only, represent each a different tradition. Few Hindu

This type of temple is particularly that of a Hindu temple, with the light shining forth from the centre in the darkness of the interior which is safeguarded by the circumambulatory itself in darkness. The devotee entering the outer door, turns to the left, having the shrine on his right, when he walks around it. Temples with their covered circumambulatory are known in later texts as Sāndhāra; the dark circumambulatory is the Andhakārikā, or Bhramanī, etc.

⁷⁰ 'Īśānaśivagurudevapaddhati', III ch. XXX. 32; so as not to be easily damaged by great storms, etc. This rule prevailed at the climax of the temple building activity in the 10th century. A royal palace, on the other hand, in the 6th century was 108 Hastas high; its base is much broader than that of a temple.

Bhūmi, thus in the chapter of the 'Bṛhat Saṃhitā' dealing with temples is not equivalent to an actual storey as it is in secular buildings. There the height of the first floor is given by the formula that it is one-sixteenth of the width of the building plus four cubits (Br. S. LII. 22-23). In a royal palace which has a height of 108 Hastas, the height of the first floor is ten Hastas and eighteen Aṅgulas and each subsequent storey is one twelfth part lower than the preceding. This restriction applies to brick walls only, and not to wooden ones. The height of the successive Bhūmis of the superstructure of a temple also decreases progressively but far more rapidly; see for example, the chapter on the South Indian proportions and S.S. LXII. 183-191. The storeys of the temple are unlike those of the houses of men though they resemble them in their position and parts.

⁷¹ Buildings represented in the reliefs of Barhut, Sāñcī, Amarāvati, etc. (Coomaraswamy, 'Early Indian Architecture', op. cit. Pls. XCII; XCIV) show the roof ridge with 'water pot' finials.

temples exist having four doors, in Kashmir; and a small temple in Sinnar, in the Deccan, for example. Jaina temples, however, as a rule have four doors.

The subservient parts (*anukāya aṅga*) of architectural and symbolic significance of the Twenty Temples are: *Prāgrīva*, the porch; *Toraṇa*, the gateway; *Candraśālā* and also the *Citraśālā*, the gabled chambers on or above the *Kapota*, the *Citraśālā* having been most probably a painted chamber, *Valabhī* being the vaulted roof itself which contains *Candraśālās* (Br. S. LV. 25, Comm.). The *Candraśālā*, as represented on the *Prāsāda*, might have indicated only an internal space by its *Gavākṣa*, the round window within its pointed arch. Such gable windows are set singly, or combined in rows; whole rows moreover are superadded so as to form a lattice or *Jāla*; for the *Gavākṣas* on the extant temples are blind windows, just as the niches are massive doors.⁷² Either of these are symbolic forms on the *Prāsāda*. The *Gavākṣas* are carved on cornices (*kapota*); the *Kapota*, the "eaves of the thatched roof" moulding, superadded one above the other had formed the *Śikhara* of slabs in its pyramidal (IA) and curvilinear variety (IIB) as well. With their closely set rows of *Gavākṣas*, these superimposed roof-edge-slabs are seen covered in their total extent as one *Jāla* or lattice of which the unit is a *Gavākṣa*. On the *Pāpanātha* Temple at *Paṭṭadakal*, built more than a century after the compilation of the '*Br̥hat Saṃhitā*', the *Jāla* can be seen in a far advanced state, in the shape of an intricate network of curves which covers the middle buttress of the *Śikhara*; whereas on its lateral parts the horizontal courses of the *Bhūmis*,—the strata of roof-edged 'slabs',—are marked each by its row of *Gavākṣas*.

The '*Viśvakarmaprakāśa*', the '*Matsya*' and '*Bhaviṣya Purāṇas*', and the S.S. LXIII, show the Twenty Temples rich in form; with many subsidiary *Śikharas* and *Kalaśas*, with a large number of *Bhūmis* and great in height and width; the *Meru* attaining to the maximum height of 100 *Hastas*, its width measuring 50 *Hastas*.

All these *Prāsādas* can be constructed either of timber, bricks or of stone. This alternative is important, for those *Prāsādas* (S.S. XLIX. 6-7) which are built in the "likeness of the chariots of the gods" should be of bricks or stone only.

The leading varieties of the list of the Twenty Temples represent Type II, and their description adds further characteristics to this type which the few preserved temples of the "early" centuries do not show.⁷³ These are especially the 5 *Āṇḍas* of the *Caturaśra* Temple, which means a *Prāsāda* with a square plan having

⁷² *Candraśālās* in the *Valabhī* are to be seen on the *Ratha* of *Nakula* and *Sahadeva* in *Mamallapuram* (Coomaraswamy, '*Indian Architectural Terms*', JAOS, vol. 48, Pl. facing p. 259). There are three *candraśālās* on the broad side of the *Valabhī*, as prescribed in the Br. S. —*Kuhara* seems to be the 'cavity' of *Śukanāsā*, etc.

The single *Gavākṣa* opening in the superstructure of the *Kandariya* Temple (Pt. VI. note 65) serves its original purpose.

⁷³ ASIAR, 1924-25, p. 125, opines that "the *Matsyapūṇa*', ch. 259, contains directions for the building of temples of two classes, the one with curvilinear *Śikhara* and the other with a storeyed superstructure. In the latter type 20 different types of temples are named. In the Br. S. the type with the curvilinear *Śikhara* finds no mention but 20 types of storied temples are described".

This interpretation, as is proved by the terminology, description and proportions assembled in charts I and II cannot be correct.

a central Śikhara with its Anḍa, and four lateral Uromañjaris, each with its crown or Anḍa, clinging to the sides of the central Śikhara. This type of temple in later versions, exists in Central India, etc., and has attained its fullest and most detailed form in Khajuraho (Pls. I, III).

These temples, says the 'Matsya Purāṇa', are meant to enshrine a Liṅga. The 'Bṛhat Saṃhitā' however speaks, not of the Liṅga, but the image (pratimā), in general, and in connection with the 'dark', double walled, fundamental forms of the temple, the square, circular, etc., in particular. The temples of the 'Bṛhat Saṃhitā' were not intended to house the Liṅga, the symbol of Śiva. Whatever the destination of the temple, Śaiva, or Vaiṣṇava, it had originally its bearing on the architectural form. The symbol or an image in the centre, the images on the walls of the Prāsāda—and the symbol fixed on the finial of the Śikhara—show the particular divinity to whom the temple is dedicated.⁷⁴

The Twenty Temples form the nucleus of a development of each variety and its ramifications. Some of these, widely dealt with by the texts, have not survived in actual buildings. So vast is the 'ocean of the science of architecture' and so rich in forms that Viśvakarman, quoted in the 'Bhaviṣya Purāṇa', I. CXXX. 36, does not appear to exaggerate when he is said to have spoken of three thousand kinds of temples of various shapes.

The 'Agnipurāṇa' embodies knowledge which must have been formulated and recorded over a long stretch of time. Twice it gives a chapter on Prāsāda Lakṣaṇa,

⁷⁴ 'Samarāṅgaṇasūtradhāra', ch. LVIII. 'Prāsāda-stavanam', verses 4-17; "Of these (64) Prāsādas 8 belong to god Sambhu (Śiva), 8 to Hari (Viṣṇu), 8 to Viriñca (Brahmā), 8 to the Lord of the Grahas (the Sun), 8 to Caṇḍikā, 8 to Gaṇeśa, 8 to Śrī (Lakṣmī) and 8 to the rest of the gods.

Vimāna, Sarvatobhadra, Gajapṛṣṭha, Padmaka, Vṛṣabha, Muktakoṇa, Nalina and Drāviḍa—these 8 belong to the enemy of Tripura (i.e. Śiva).

Garuḍa, Vardhamāna, Śaṅkhāvarta, Puṣpaka, Gharāṭ, Svastika, Rucaka, Puṇḍravardhana—these 8, the ornaments of the city (pur), belong to Janārdana (Hari).

Meru, Mandara, Kailāsa, Hamsa, Bhadra, Uttuṅga, Mīśraka, Mālādhara, these 8 Prāsādas belong to Brahmā.

Gavaya, Citrakūṭa, Kiraṇa, Sarvasundara, Śrīvatsa, Padmanābha, Vairāja and Vṛtta—these 8 Prāsādas of auspicious features belong to the Sun. Nandyāvarta, Valabhī, Suparna, Siṃha, Vicitra, Yogapīṭha, Ghaṇṭānāda and Patākin, these 8 abodes of God belong to Caṇḍikā.

Guhādhara, Śālāka, Veṇubhadra, Kuñjara, Harṣa, Vijaya, Udakumbha and Mōḍaka, these 8 auspicious Prāsādas should be constructed for Vināyaka (Gaṇeśa).

Mahāpadma, Harmya, Ujjayanta, Gandhamādana, Sataśṛṅga, Navadyaka, Suvibhrānta and Manohārin, these 8 belong to Lakṣmī.

Vṛtta, Vṛttāyata, Caitya, Kiṅkiṇī, Layana (cave-temple), Paṭṭiśa (tent or made of cloth), Vibhava and Tārāgaṇa, these 8 Prāsādas should be constructed by one skilled in the Vāstu-Śāstra, for the rest of the gods."

With this enumeration however has to be compared S. S. LV. 105-108. "Kailāsa is the abode of Maheśvara, Garuḍa of Viṣṇu, Padma of Prajāpati, Gaja (Dvīpa) of Gaṇanātha. These are not to be constructed for any other god. Triviṣṭapa is an abode of all the gods. The different forms of Prāsādas, other than these belong to all the gods without distinction."

To this have to be added further specifications, such as ch. LVI. 35. "Meru for Hari, Hiranyagarbha, . . . Bhāskara and not for any other god", ch. LVII passim, and LIX. 4.

It would not be safe to attempt a classification of the temples on the basis of their dedication to the deities at the age of the S.S. Nonetheless a definite shape of the temple originally implied a definite dedication which was also expressed by its name. This is shown in the 'Viṣṇudharmottara' (see Appendix).

the features of the temples. The earlier one, XLII, is practically identical to the respective passages in the 'Hayaśirṣapañicarātra' from where it seems to have been absorbed into the 'Agnipurāṇa'. The later chapter CIV, also has its prototype in the 'Hayaśirṣapañicarātra'; the proportions given there are less pure than in all the other 'early texts', it appears further removed from the principles and origins and nearer to the contingencies of actuality. The Śikhara is given particular attention, for not only are its vertical proportions dealt with as in the other texts also, but the horizontal proportions are also stated, although of its upper part only. The width of the Veditā is given as 10; this is the width of the Śikhara where the Śukanāsā ends; the width of the Śikhara at its base is not given; assuming however that it is of the type of an Orissan Śikhara, the two may be same. The width of the shoulder course is 5 parts, or half as wide.⁷⁵ The neck occupies three parts and the Aṇḍaka (Āmalaka) has a width of four parts (CIV. 23). The preceding verse goes even further and details the proportions of the finial (Cūla).

These proportions however are no longer those of the Twenty Temples but of a different variety of the same type (II). They are known as the Forty-five Temples.

The Twenty Temples represent a liberal assortment of architectural shapes. A selection was made and five basic shapes were to ramify in the several schools of mediaeval architecture, in forty-five variations and also in different sets of sixty-four shapes each.

The Twenty Temples however are not forgotten. They are the Nāgara Prāsādas of ch. LXIII of the 'Samarāṅgaṇasūtradhāra'; their names are incorporated in those of the temples in chapters LVII and LIX, and in the hundred—and one—temples of the 'Viṣṇudharmottara'.

⁷⁵ The width of the shoulder course is generally given as 6 parts out of the 10 parts allotted to the base of the Śikhara. See p. 208, note 6r.

B. THE FIVE VIMĀNAS AND THE 45 TEMPLES

Vairāja, Puṣpaka, Kailāsa, Maṇika and Triviṣṭapa, these 5 chariots of the Gods, are the primary shapes. Meru heads the list. The first is square, the second rectangular, the third is round, the fourth elliptical and the fifth is octagonal. Each of them has 9 subvarieties. So there are altogether 45 varieties of these Prāsādas ('Agnipurāṇa', CIV. 11b-21).

The chart on p. 278 gives their names according to the 'Agnipurāṇa', Garuḍapurāṇa' and the 'Prayogamañjarī'. The last named text is a later, South Indian compilation.⁷⁶

Meru is the foremost and highest of the twenty Temples (p. 270A). It is also the foremost of the 32 Jātītara temples of the Southern school as represented in the 'Īśānaśivagurudevapaddhati'. III. ch. XXVIII. 10. The most eminent of various lists of the temples is likened to the World Mountain.

The 45 temples are distinguished by Śikhara, Kaṇṭha and Āmalasāraka (A.P. CIV, 10-11). Their names are those of Nāgara and Lāṭa Prāsādas (verse 22). They are Nāgara Prāsādas (chart I) built in a particular region, Lāṭa or Gujarat. Their classification (p. 278) is rational; it discards certain shapes of the earlier lists (chart II) such as the six and sixteen sided plans; a consolidated school within the Nāgara tradition has laid down its programme.

A digression may be permissible here. Verses 11-12 may also mean that the 5 Vimānas, the Chariots of the Gods, are placed on the head of the Meru. This has no bearing on the 45 temples. Meru however not only heads many lists of temples; it should also be contemplated as the support of some. These are the High Temples (Vimāna; pp. 194 f, 293). Meru, as the support of the Vimāna of the gods has the shape of the mountain or of the pillar; it is the cosmic axis. Its architectural form is the Prāsāda⁷⁷; and also the Stambha⁷⁸, the free standing pillar. The Stambhas on which Aśoka in the third century B.C. had his Dharma inscribed are better known than others, such as the Mānastambhas of the Jains or the Āyakakhambhas of the Buddhists and other free standing pillars which carry a small High Temple. The former bear on their capital a small pavilion supported on four pillars; the latter terminate with an abridged chapel shape.

⁷⁶ The 'Prayogamañjarī' VI. 15, says: People of this world have neither enthusiasm and knowledge nor the money to have the temples constructed in all these varieties. The text seems to be considerably later than the two Purāṇas, see note 67, and explains, to some extent, the absence amongst preserved monuments of certain shapes, such as especially the elliptical temples.

⁷⁷ One of the generally accepted forms of the 'Meru' is the stepped pyramid; in that form (cf also Type I A) it has wide currency under the very same name Meru, in Greater India; miniature models of the Meru are kept in Burmese monasteries and sanctuaries. They too, have the shape of a stepped pyramid (R. Heine-Geldern, l.c. Fig. 23).

⁷⁸ Fergusson HIEA, vol. II. p. 81; Figs. 302, 308. A. H. Longhurst, 'The Buddhist Antiquities of Nāgārjunakoṇḍa', Memoir 54, ASI. Pl. XI b, c.

An indispensable part of the Buddhist Stūpa is the Harmikā, the railing which surrounds its shaft where it emerges from the dome-shaped pile of the monument. This railing is square (caturaśra koṣṭha); it encloses moreover a small pavilion or chapel—similar to that on the Āyakakhambhas and also to the High Temple of a Drāviḍa Prāsāda—where it is not represented in the shape of a solid cube. The part where the shaft of the central pillar of the Stūpa emerges above the Harmikā is called Devatā Kotuva in Ceylon. It is there that the 33 gods reside, in their heavenly world, above the sphere guarded by the Regents of the directions of space. The hierarchy of divine manifestation is thus accommodated in the monument, it is especially located within its vertical axis, the Cosmic Pillar. The Harmikā and Devatā Kotuva are above the expanse of the Stūpa, and are part of as well as

Āmalaka and Kalaśa; the date is 'late mediaeval' (J. Ph. Vogel, 'Catalogue of the Archaeological Museum at Mathurā', p. 193). The pillar on the other hand, which supports an Āmalaka (Bedsa, Karli, Nasik, etc.) is a cognate symbol (Part VIII).

⁷⁹ The names [A.P.] are those of the Agni Purāṇa.

The Names [G.P.] of the Garuḍa Purāṇa, the others are common to G.P. and A.P.

The names marked* occur also in the lists of the "Twenty Temples".

surrounding its axis; they exactly correspond in place and function to the 5 Vimānas as 'High Temples'.

Not only in India itself, but also in Indian colonial architecture, the gods are known to reside on the top of Meru. In Bali, the central pillar, where it forms the peak of the temple is hollowed immediately below its point. Nine gems are deposited there of which the one in the centre denotes the presence of Śiva. This central post does not exist actually in the stone and brick temples of India. Its position and extent however are indispensably part of the Prāsāda (Part VI).

The position is marked by the central, vertical axis around which the temple is built; its extent is shown by the shaft or neck (grīvā, kaṇṭha) which emerges above the shoulder-course (skandha) of the highest level (bhūmi) of the truncated super-structure. The shaft or neck, in the temples of South India, assumes the shape of the walls themselves of the High Temple (vimāna); they are, moreover, also called by the name of neck (kaṇṭha; gala). In such Prāsādas, however, where there is no High Temple, the round shaft emerges from the shoulder course and is clasped at a given distance, by the Āmalaka.

The top of Cam temples in Cambodia is crowned by a Liṅga; it is the seat proper of divinity. The shaft of the central pillar, if extended to the bottom of the Prāsāda holds the central Liṅga in the Garbhagrha of a Śiva Temple (Fig. i, on p. 212). The top of Indian temples is invariably surmounted by a finial of which the Kalaśa is the most important part. In this jar the Golden Prāsāda -Puruṣa is installed (Part VIII).

The central shaft of the temple holds the divine presence; it is specially manifested on the lowest level, in the womb, the Garbhagrha, and on the highest level, above the body of the temple. The vertical column of the temple is the cosmic trunk and its quadruple ramifications are the four directions of space in which the Prāsāda has its extension.⁸⁰ The vertical column of Prāsāda and Stūpa alike has its prototype in that vertical shaft across the strata of the Vedic altar formed by the naturally perforated 'bricks', the Svayamātrṇā stones, which were placed in vertical succession above the Golden Puruṣa.

The Āmalaka, the cogged ring stone, is an equivalent of the highest of these perforated stones: it was placed above the last, the fifth layer of the Altar. Where no Āmalaka clasps the 'neck' of the pillar of the temple, the High Seat of divinity is placed in the High Temple, the "very small" (kṣudra-alpa) Vimāna, which crowns the South Indian Prāsāda. The shapes of this High Temple are square or circular; or rectangular or elliptical, the latter two being considered special forms of the former; the octagon too is one of its shapes.

The shapes only and not the names of the 5 Vimānas or Chariots of the Gods, have been given to the High Temples. Triviṣṭapa is the heaven of Indra, and of the 33 gods; Triviṣṭapa is also the name of the chariot of Indra. Another name is Vairāja; it belongs to the cosmic intellect, Virāj, who rules over and unites the whole manifestation which is integrated in himself, Virāj, the non-supreme

⁸⁰ 'Dikṣākhāmūlakāṇḍa', of the Deopāra inscription of Vijayasena, as understood by P. Mus, op. cit. p. 413. Cf. 'Ep. Ind.' I. p. 314, and R. C. Mazumdar, 'Inscriptions of Bengal', vol. III.

Brahman. It is therefore also the name of the chariot of Brahmā. The other names are those of the celestial chariots, the Kailāsa of Śiva, the Puṣpaka of Kuvera, and the Maṇika of Varuṇa. The chariots of the gods, the sky-travellers, have alighted on top of the World-Mountain in which inheres the cosmic pillar, and show by their shape to whom they belong. The Five Vimānas on the top of the temples correspond to the other small 'High Temples' set up on pillars such as the Caturaśra-koṣṭha, the Harmikā, below the Devatā Kotuva, within the central shaft of the Stūpa, and to the small chapels which crown the Māna-stambhas and Āyaka-khambhas. Meru which supports them is a free standing pillar or the central shaft of the monument, the temple.

The pillar, the shape of the Cosmic Axis on which rests the Āmalaka or the Vimāna of God, is sheathed in the body of the temple. The mass of the monument, the temple, is fitted around the pillar and its mantle has many forms. That of the 45 temples is hemmed by the shape of the 5 Vimānas and has an Āmalaka for its crown. In the South Indian version, a small Vimāna, alike to one of the five celestial chariots, is given the place of Āmalaka and Kaṇṭha.

The Vimāna placed on top of Meru is the small domed shrine, which is placed on top of the flat roof of a dolmen temple of one storey (Fig. c, Part VI) or its repetition in the vertical and forming a pyramid of many storeys. In its simplest and original form this type of the temple consists of one such storey only, the prism or cube of the dolmen type Garbhagrha. On this flat roofed shrine thus another is placed. This indeed is the form of the small shrines of South India which are called Alpa-prāsāda. In their aggrandised shape, having one Garbhagrha above the other, or a series of storeys in receding tiers, these temples, called Meru, would be stepped pyramids, like those preserved in South India but without the parapet of chapels around each storey. In Northern India too, this shape occurs but in a different version. In the 'terrace temples', in Ahicchatra and Paharpur, it is the solid stepped pyramid consisting of terraces which forms the Meru. It is traversed by a shaft, square in section and equal in area to the High Temple in the centre of the topmost terrace.

The Meru below the Vimāna, the Mountain on which rests the High Temple, is not only an Indian architectural concept. The cubical or rectangular sub-structure of the Zikkurat⁸¹ is also the Mountain; on it is placed the Hut, the dwelling of divinity.

⁸¹ W. Andrae, 'Das Gotteshaus und die Urformen des Bauens im alten Orient,' (1930), speaks of the cubical or prismatic sub-structure of the Zikkurat as being the Mountain. On it is placed the Hut, the abode of God.

C. THE FIVE VIMĀNAS AND THE 64 HALL TEMPLES

From the Five Vimānas on which the gods travel in the air and from the five temple shapes built in their likeness were derived forty-five varieties of temples, square, rectangular, circular, elliptical and octagonal, nine of each kind.

From the self-same five shapes of the Vimānas, the 'Samarāṅgaṇasūtradhāra', Chapter XLIX, derives 64 kinds of temples, Vairāja, the square one, having 24 varieties and the other 10 varieties each (Chart on p. 281). They are to be built in towns and are made of stone or burnt brick (S.S. XLIX. 6-7). Their names are

THE 64 TEMPLES DERIVED FROM THE 5 VIMĀNAS ACCORDING TO 'SAMARĀṆGAṆASŪTRADHĀRA', ch. XLIX. 22—202.

I Vairāja, the Vimāna of Brahmā.	II Kailāsa, the Vimāna of Śiva	III Puṣpaka, the Vimāna of Kuvera. Prototypes of :	IV Maṇika, the Vimāna of Varuṇa.	V Triviṣṭapa, the Vimāna of Indra.
24 varieties of Square Prāsādas.	10 varieties of Circular Temples.	10 Oblong Temples.	10 Elliptical Temples.	10 Octagonal Temples.
Rucaka ⁸² Sīṃhapañjara Citrakūṭa Bhadra Śrikūṭa Uṣṇiṣa Śālāgrha Gajayūthapa Nandiyāvarta Avatamsaka Svastika Kṣitibhūṣaṇa Bhūjaya Vijaya Nandī Śrītaru Pramadapriya Vyāmiśra Hastī Jātiya Kuvera Vasudhādhara Sarvatobhadra Vimāna Vimuktakoṇa	Valaya Dundubhi Prānta Padma Kānta Caturmukha Maṇḍūka Kūrma Taligrha Ulūpi	Bhāva Viśālā Sānmukhya Prabhava Śibiragrha Mukhaśālā Dviśālā Gṛharāja Amala Vibhū	Āmoda Raitika Tuṅga Caru Bhūti Niṣevaka Niṣedha Sīṃha Suprabhā Locanotsava	Vajraka Nandana Saṅku Mekhalā Vāmana Laya Mahāpadma Harṣa Vyoma Candrodaya

⁸² Rucaka like Meru, is the name of more than one type of temple. Rucaka is the name of a mountain ridge which projects from the base of Meru, on the South. Other mountains, whose names were given to temples are:

Mālyavān (ch. 65), described as a Bhūmija Prāsāda ; Triakūṭa (ch. 57) ; Niṣadha (ch. 65), a Bhūmija Prāsāda ; Gandhamādana (ch. 59) ; Nandana, Himavān, Śṛṅgin, Nīla, Śveta, etc.

THE HINDU TEMPLE

partly the same as in the list of the Agnipurāṇa (p. 278); the square varieties vastly increased in number; moreover, certain temples (Hamsa), described in the first list, are amongst the octagonal temples in the second; or, Mahāpadma, circular in the one list, is octagonal in the other. The names thus do not denote the same shapes; the name of Meru, however, which is particularly mentioned and actually heads the first list is absent from the second. In short, the 64 temples of Chapter XLIX of the 'Samarāṅgaṇasūtradhāra' differ from the 45 temples of the other list although their prototypes in heaven and shape of their horizontal sections are the same.

The 64 temples of Chapter XLIX are low buildings; in the centre is the Garbhagrha; its position is marked by four pillars only (verses 64, 80, etc. Fig. on p. 82). It is surrounded by pillared or walled corridors (ālinda, etc.); these alternate with broader pillared halls (śālā); pillared porticoes (prāgrīva) are placed in front of the doors of the inner walls; Prāgrīvas also project beyond the outer walls, which, as a rule, have two windows (gavākṣa) on each side. The plan of the temple is laid out in concentric zones, the method being that the square or any other of the five shapes of the plan is divided into a given number of equal parts (bhāga); these range from four to twelve in the different temples, the width of the Garbhagrha being 2 parts; the rest measure the extent of the ground of the various pillared halls and corridors, separated in the larger temples by an internal wall; they have one or three Alindas all round. Their colonnades are formed by pillars with equal columniations, one Bhāga being the unit, whereas the pillars are doubly spaced on the 4 sides of the Garbhagrha so that a cross results in the plan formed by the broad, east-west and south-north corridors.

Scheme of Plan or Samsthāna of the temple Svastika, S.S. XLIX, 62-67.

Agnipurāṇa', II. ch. 11). Some of the names of the Bhūmija Prāsādas are amongst those of the 64 temples of the 'Viṣṇudharmottara' (see Appendix).

The Garbhagrha, if it has four walls, has sometimes four doors or it has only one entrance.⁸³ Toranas or gates are set up in the larger temples, in the middle of two pillared Ālindas (in the temple Prthivijaya, for example; verses 80-88); the distance between their posts has the width of the Garbhagrha or Devakoṣṭha; the latter term is more appropriate where the innermost sanctuary is marked by four pillars only, one in each corner and has no walls.

The Prāsāda is raised on a socle (pīṭha) whose height is one part (bhāga); stone steps (sopāna) from one or two sides lead up to it in the temple Gajayūthapa (verse 44).

The temple Rucaka (verse 25-28),⁸⁴ the first of the '64 temples', within its pillars, etc., is so to say the nucleus of the others; it has a width of four parts (bhāga); the vertical proportions of the square Garbhagrha, measuring two parts are: one part for the socle (pīṭha) and 3 parts for the height of the Prāsāda of which 1½ parts are the height of the pillars (stambha); above them is the 'upper part' of the Prāsāda; it has 3 roofs (chādya trayam), a neck (kaṇṭha) and Āmalasāraka. (Cf. the upper portion of Fig. c, Part VI). The temple is as high as it is broad. The height of the door is 1 part, its width is half of it.

The proportions of the Garbhagrha and its parts do not change. In the square hall temples, its width is invariably 2 parts, whether the temple covers an area of which the side has 4 or 12 parts. Its door is always 1 Bhāga (part) high, and half as broad. The Garbhagrha is the unchangeable nucleus of the several zones which are made to encompass it;⁸⁵ the temple Rucaka is its shell. If circular, the disposition of the ground plan remains the same in principle, the single corridors measuring 1 Bhāga in width, the intercolumniations also being the same. A simple example of this type is the wood-brick temple excavated at Bairat (Jaipur), of c. the 3rd century B.C. Low pitched roofs (chādya) crowned by an Āmalasāraka (Āmalaka) raised on its neck (kaṇṭha) cover the temple 'Rucaka'.⁸⁶ The other temples described in Chapter XLIX, are covered by one Chādya which is circular on round temples, or by a double roof, Dvichādya; the portion of the colonnade under the protracted eaves, is called Valabhī.⁸⁷

⁸³ The circular temple 'Valaya' is called Caturmukha if it has 4 doors and Maṇḍūka if it has one entrance only (S. S. XLIX. 119-121).

⁸⁴ The temple Rucaka, of ch. XLIX. 25-28, differs from the temple of the same name and described in ch. LVI. 44-50, of the 'Samarāṅgaṇasūtradhāra'. In ch. LVI, it has a Śikhara; but the rhythm of its ground plan is the same as in ch. XLIX.

⁸⁵ The innermost sanctuary, in the oblong temples, is a double square; in one of the oval temples (Suprabhā) it is octagonal, demarcated by 8 pillars (verse 181). The rectangular temples have the shape of a double square; in the elliptical temples the lengths of the two main co-ordinates are, analogously, 8 and 4. Similar in plan, though without walls, but having a railing instead are the circular sanctuaries represented in the reliefs of Barhut and early Amarāvati. The rectangular temples shown there are open pillared 'hall' temples. cf. p. 118, 145.

⁸⁶ A miniature Dvichādya with its Āmalaka would thus also be the proper description of the roof of the water pavilion of Mahākūṭa. Different kinds of roofs are here referred to, the one of slabs being perfectly flat; cf. also the central Indian Gupta temples, the other having a low pitch.

⁸⁷ Valabhī, takes sometimes the place of Prāgrīva (verse 201). Valabhī is also one of the names and shapes of the Kapota or Mekhalā, the cornice-moulding of the entablature

The 'hall temples', without internal walls, with rows of pillars, resemble in plan the Ladh Khan Temple in Aihole and also the circular temple in Bairat, if one is to compare these preserved examples with the richer and later varieties of Chapter XLIX of the 'Samarāṅgaṇasūtradhāra'. Such are its 64 Prāsādas built in accordance with the five shapes of the chariots of the gods.

Although they are generally low, spreading structures, the arrangement of their roof having an Āmalasāraka, with its Kanṭha in some cases, was similar to the superstructure (Type I A) as it is known in its early phases. All these temples however having one roof, or a double and even a triple roof are without a superstructure proper. This is clearly stated in a following Chapter (LII) of the 'Samarāṅgaṇasūtradhāra'. The rudiments of a superstructure (Type I A) are, however, in the description of the upper portion of the temple 'Rucaka' as much as they are in the slabs and the Āmalaka of the Liṅga shrine at Mahākūṭa and various chapels represented in the ancient reliefs and paintings.

The hall temples were buildings not primarily destined, it seems, for Hindu worship. They lent themselves to Buddhist rites and had to be condensed to serve the purpose of the Hindu temple. While they did not contribute towards the origin of the Hindu temple they also did not essentially determine its ultimate form. They were, however, utilised and adapted for its purposes.

The 64 temples had to undergo a process of condensation of their plan, until the internal galleries and their pillars were compressed in one internal circumambulatory between thick walls, when its Śālās, Prāgrīvas and Valabhīs became 'Anukāya-aṅgas' or parts of the wall itself. The hitherto diffuse balance of the plan laid out around the centre became organised from within. The new compactness was a necessity so that the high superstructure might tower over the centre and rest securely on the walls of its base.

While following the one account of the 45 Prāsādas ('Agnipurāṇa', CIV), Nāgara and Lāṭa Prāsādas were built alike in shape to the five celestial chariots, in the other tradition the 64 Temples, alike in plan to those of the Five Chariots, had to 'carry' divinity; this was expressed subsequently in a monumental sense by the addition of the superstructure (S.S. LII. 20-22), which thus 'conveyed' divinity to the devotee coming from afar.

The 'Samarāṅgaṇasūtradhāra' (Ch. XLIX) describes 24 temples having a square plan; their prototype is Vairāja. From these, one storeyed temples, further eight Vimānas were formed and they have Śikharas (S.S. LII. 20-22). Five of them, Rucaka, Bhadra, Sarvatobhadra, Avatamsa and Muktaṇa are in the list of the square temples (Chart on p. 281); the shrines of a certain type remained Rucaka or Bhadra, etc., even though a Śikhara was superposed. The three other temples are Meru, Mandara and Vardhamāna; these, and especially the images of the Mountain, are absent from the list of the 64 chariot-like temples; the

or upper zone of the wall of the temples which have a superstructure. The eaves of the Chādyā too, are retained amongst the profiles of the entablature; on some temples they are doubled or trebled (dvichādyā; trichādyā) and form the canopies by which the images on the walls are shaded and protected (Pl. III). A special variety of this architectural Anukāya is known as Mallacchādyā (S.S. LX. 85, etc.).

images of the mountain now appear super-added to the various hall temples (Fig. d, p. 183) and are its Śikharas.⁸⁸

⁸⁸ Some of the temples in Aihole are hall temples with a Śikhara superadded either in the original design (Fig. d, Part VI.) or as an afterthought (Durga temple). As part of the original design, the curvilinear superstructure, the Śikhara, rises above the Garbhagrha of the rectangular hall temples at Alampur (Raichur, Hyderabad) from their flat roofs ('Report of the Archaeological Department of the Nizam's Dominions,' 1926-27, Pl. X). Cf. also the Pāpanātha Temple in Paṭṭadakal. The hall temples in Alampur serve as Maṇḍapa and Sāndhāra Prāsāda combined. These combinations lacked consistency and were not continued beyond the ninth century.

NĀGARA, DRĀVIḌA AND VESARA

The early sources, from the 'Bṛhat Saṃhitā' onwards to the earlier chapters of the 'Agnipurāṇa' classify the temples neither according to Nāgara, Drāviḍa and Vesara nor according to their regional distribution. They give the norms of proportionate measure and list 20 possible shapes of the Prāsāda which conform with the canons.

Fifteen out of the 20 names of the early texts are repeated amongst the "45 Temples" ('Agnipurāṇa', CIV, etc.). Amongst the five which are not repeated are the Square, the Octagonal, the Sixteen sided and the Round Temple; they have no place in a classification which itself is based on 5 prototypal shapes, namely the square, oblong, circular, elliptical and octagonal. The earlier list having been rationalised and augmented, the 'Agnipurāṇa' CIV, 22, moreover, adds in the verse immediately following the standard proportions and the subsequent enumeration of the 45 names: "These are the names of Nāgara as well as of Lāṭa Prāsādas." Lāṭa is the ancient name of 'Gujarat': it is the country to the west of Ujjain and to the south-west of Vidarbha (Berar). Nāgara however is not amongst the names of ancient Indian geography.

The name Nāgara occurs frequently in the 'Īśānaśivagurudevapaddhati' and the 'Samarāṅgaṇasūtradhāra'. Both these texts belong approximately to the same age, the one belongs to South India, the other to Dhārā,⁸⁸ in Malwa; the first named text treats of one type of temple only,—the Drāviḍa,⁸⁹ whereas the latter is a compendium dealing with the main types then known. Both the texts are contemporary with temple architecture at its climax. Nāgara, in the 'Īśānaśivagurudevapaddhati' occurs in connection with the names Drāviḍa and Vesara; in the 'Samarāṅgaṇa-

⁸⁸ The 'Īśānaśivagurudevapaddhati,' embodies the teachings of a long line of Siddhāntikas who were influential all over India during the ninth to eleventh centuries and later. Part III, the chapters of the 'I.P.' dealing with the architecture of the temples may have been written at the Gorāṭika maṭha in Dhārā, if not in a monastic establishment even further south.

⁸⁹ This name however is absent from chapters XXVIII and XXIX which treat of the Prāsādas and Vimānas and classify them according to their 'Alaṅkāras' (XXVIII. 23). This term is used in a sense analogous to 'Lakṣaṇa' in the 'Bṛhatsaṃhitā', etc., and denotes the specific shape of the various temples. Each has a name of its own, Nalina, etc., Meru, etc. In chapter XXX. 41-42, the 'Kṣudra-alpa-Vimānas', the diminutive High Temples at the top of these structures are labelled according to their shapes, as Nāgara, Drāviḍa and Vesara. It is in this restricted application only that this terminology applies to the South Indian temples which themselves are known under the regional and ethnical designation Drāviḍa. In this, its original application in Vāstusāstra, the name is absent from chapters XXVIII and XXIX. To the South Indian school of architects the temples built by them were the temples; there was no need to designate them as South Indian or Drāviḍa. The 'Bṛhatsaṃhitā', too, treats of the temples simply, without calling them Nāgara or any other name which would indicate their 'style'.

The 'Viśvakarmaprakāśa' and 'Matsyapurāṇa' too, are without the classification Nāgara, etc., although they treat more fully of the Twenty Temples as they were built in the sixth century and earlier.

sūtradhāra' however, the name Vesara does not occur, whereas Nāgara and Drāviḍa are frequently discussed and the triad of names is completed by the term Vārāṭa.⁹¹

Another datable source is an inscription from Holal, Bellary District.⁹² This Western Cālukyan inscription speaks of 4 types of buildings, called Nāgara, Kāliṅga, Drāviḍa and Vesara.

These three sources belong to the Deccan and the South. A South Indian Āgama further clarifies the designations by explicit definitions. In chapter XLIX. 1-2, the 'Kāmikāgama' assigns the Nāgara temples to the country from the Himālaya to the Vindhya; Vesara from the Vindhya to the river Kṛṣṇa; and Drāviḍa from the Kṛṣṇa to Cape Comorin. This ternary is based on that of the Guṇas: Sattva, Tamas and Rajas.⁹³ Although the ternary of the Guṇas constitutes a total—that of the nature of the world,—three further classifications follow, in the 'Kāmikāgama', the ternary of Nāgara, Drāviḍa and Vesara.⁹⁴ Sārvadeśika, "proper to all countries", Kāliṅga and Vārāṭa form the other ternary of styles 2-3). Kāliṅga is the country now known as Orissa, whereas Vārāṭa has no place in the Sanskrit accounts of ancient Indian geography, and is discussed in the subsequent pages.

As the ternary Nāgara, Drāviḍa and Vesara looms large in contemporary discussions on Indian architecture and has found more than one interpretation it is here being tracked to its sources.

NĀGARA.—The word Nāgara, as derived from Nagara, a city, means 'pertaining to a city or town'. This is a generally accepted meaning, also in Vāstuśāstra. "Prāsādas of stone and baked brick should be built for the adornment of towns (nagara)."⁹⁵ The shapes of these Prāsādas should be in the likeness of the Five Vimānas, the chariots which Brahmā had created for the gods with the purpose of carrying them on their heavenly ways. As the gods are accommodated in heaven, so are they accommodated on earth, and in the latter case their habitations conform with the particulars of living in different towns in the different parts of India. As

⁹¹ None of these three names however is given in ch. XLIX which deals with the "hall temples". The triple distinction is made in the chapters beginning from LVII only.

⁹² 'Annual Report of the Assistant Archaeological Superintendent, Southern Circle for Epigraphy', 1915, pp. 49, 90. The inscription is in the Mukha-maṇḍapa of the Amṛteśvara Temple at Holal, Bellary District, "built long before the Mohammedan conquest of Northern India".

⁹³ Tamas, the descending tendency, is here given the position of Rajas, the expanding tendency, as Vesara is Tamas, while Drāviḍa is Rajas.

⁹⁴ The sequence Nāgara, Vesara, Drāviḍa belongs to the geographical distribution, whereas the sequence Nāgara, Drāviḍa, Vesara gives first the two main styles of which is composed the Vesara style. It indicates also the chronological position of the style Vesara (see infra).

⁹⁵ Kāśyapa, quoted by Utpala, in his commentary to 'Bṛhat Saṃhitā', LV. 16, similarly enjoins that "temples, conforming with the prescriptions should be built according to the towns (pura)".

Nāgara therefore has also been taken to mean especially "pertaining to Śrī Nagara or Pāṭaliputra, the ancient Metropolis of India", R.D. Banerji, 'History of Orissa', vol. II. p. 333, which however is not likely for the designation of the temple types as Nāgara, Drāviḍa, etc. is later than the 'Bṛhat Saṃhitā', when Pāṭaliputra had long ceased to hold the leading position. Nāgara may also be derived from Nāga. The Vāstupuruṣa "has the shape of a Nāga" ('Viśvakarmaprakāśa', 1.97, 99f.)—and the Vāstunāga who is Śeṣa or Ananta, encircles every site (p. 62).

in heaven, so on earth, are the Vimānas of the gods; they are made of substances which are proper to each, of stone and burnt brick, specially should the temples be built in towns; for those which are known as Vimānas on the ways of the gods (suravartmani) are called Prāsādas when they are immovable (sthāvara; S.S. LV. 104-5).⁹⁶

Another word which means a (fortified) town or city is Pura. This word also refers to man ('Nirukta' I. 13, II. 3) for he too is a residence. Thus Brahmapura is the heart as the centre of Being, the residence of Brahman, the Supreme Spirit.

On the island of Bali, the word generally used for temple is Pura. This meaning, however, is but one of the possible meanings of the word Nāgara.

The Twenty Temples—of the early Vāstu-śāstras hitherto discussed—bear no particular name comprising them in these texts. There are no others; they represent all the possible shapes of the Prāsāda. The self same Twenty Temples however are also the subject of one chapter (LXIII) at least of the 'Samarāṅgaṇa-sūtradhāra'. It treats of Nāgara-Prāsādas. The Twenty Temples in the eleventh century are called "Nāgara". This is how they are distinguished from Drāviḍa Prāsādas (chapters LXI, LXII) and Vārāṇsa Prāsādas (ch. LXIV). Once they were 'The Twenty Temples'; now they are known as Nāgara Prāsādas.

Another meaning of Nāgara is Universe (Viśva).⁹⁷ The temple, the Universe in a likeness, is Nāgara for it rests on the Nāga, the Vāstupuruṣa, who supports the Universe and is Śeṣa, the Remainder.

Between the fourth and seventh centuries A.D., the Hindu temple, it appears, consisting essentially of the perpendicular walls of the Garbhagrha and a super-structure, the Śikhara, was being given shape. In the subsequent period local schools worked out in logical sequences, the specific features (lakṣaṇa) of the Prāsādas. One of these schools had its centre in Drāviḍadeśa, the country of the Drāviḍas, or South India proper from Madras to Seringapatam and Cape Comorin. There the temples called Drāviḍa were built such as are preserved from the seventh century and in the subsequent centuries when the texts referred to were compiled. Not only however in the Drāviḍa country itself but also in the Kanarese part of the Deccan, where Aihole, Mahākūṭeśvar, Bādāmi and Pattadakal, are situated were such temples built, at an earlier date even. This Southern school contributed a particular type of temple to the architecture of India and a particular branch of Vāstuśāstra to its knowledge. The South Indian text books on architecture are

⁹⁶ In some of the temples this version of their origin is overdone; built of stone, they yet have wheels, carved in stone: even this, inappropriate, form has found a great Sthapati to build it in the Sun temple at Konaraka. Other wheeled, stone built temples belong to South India, the shrine at Darasuram for example.

⁹⁷ 'Nanārthārṇavasamkṣepa', by Keśava Svāmī, śl. 1008-9, TSS. p. 135, has "nāgaram viśva" and also "nāgaram kaseru", Kaseru or Kaserumat is one of the nine divisions of Bharatavarṣa or Jambudvīpa, but it is not known which part of India is denoted as Kaseru. If it is Madhyadeśa, this would agree with a verse of the 'Aparājita-prcchā', Fol. 5; (Ms. in the S. K. Ray collection, quoted by S. K. Sarasvati, l.c. 'Indian Culture', vol. VIII. p. 183); see note 106.

Another meaning of Nāgara is given in the Vācaspatya, s.v.: "Dhanurvedasya sūtram vai yantrasūtram ca Nāgaram"; see part I, note 20. In its Vedic affiliation, architecture might have been classified as Nāgara, though the meaning of Nāgara in this application is not given. Apte, Dictionary, s.v. gives "desire of final beatitude" as one of the meanings of Nāgara.

copious. They treat as a rule, exclusively of the particular South Indian type of the temple in its varieties which they designate by appropriate names.

In the 'Bṛhat Saṃhitā' (LII. 1), Varāhamihira spoke of Vāstu-śāstra as transmitted for the pleasure of the astrologers from Brahmā to his days by an unbroken series of sages. The 'Īśānaśivagurudevapaddhati' however speaks of Brahmā, of the succession of sages, and Maya as having described the Vimānas, such as the twenty Mukhya-prāsādas, etc., which are dealt with in this text (I.P. III. ch. XXVIII. 3-4). Whereas the whole science of architecture in its primeval connectedness with the stars and the universe is present to Varāhamihira in the sixth century, the later text applies it to a description of the temples only; it adds moreover, the name of Maya to that of Brahmā. It begins (śl. 7) with the description of 20 main (mukhya) temples, called Nalina, Pralina, etc. The number 20 is the same as that of the more ancient lists, the names however are others and those at the beginning of the list have not the cogency of the names of the Mountain (Meru, Mandara, Kailāsa) which introduce the Twenty Temples of the 'Bṛhat-saṃhitā'. These comprised every shape of the temples then known. The later text degrades to the "second class" the names of the Mountain; they introduce the Jātītara Vimānas. The special knowledge embodied in the 'Īśānaśivagurudevapaddhati' seems to be particularly that which had in Maya its main exponent.

Varāhamihira knew that architecture had its beginning in Brahmā. In a different context (Br. S. LV. 29-30), he mentioned amongst the sages or preceptors of architecture Viśvakarman and also Maya, an apparent controversy between these two great teachers as well as its solution. Maya is The Architect, the 'arch-builder' of the 'Īśānaśivagurudevapaddhati'; tradition knows him to be the master-builder of the Asuras, whereas Viśvakarman is the Architect of the gods. Viśvakarman reveals the Sthāpatya Veda, he is The Great Architect⁸⁸. No regional or ethnical distinctions however have been made in the chapters on architecture of the 'Bṛhatsaṃhitā', nor are they taken into account by Utpala, the commentator, whereas iconographical distinctions of this kind are referred to at least in one instance, in the text and by the commentator, in the chapter on Pratimālakṣaṇa (Br. S. LVII. 4; 15). Iconometrical differences in the facial proportions of the images are noted and Nagnajit is the authority referred to⁸⁹.

The 'succession of sages' in their unbroken continuity is a reality to the earlier text, whereas the later text makes it halt before one Great architect, Maya, who is the mythic builder, of the South Indian branch of the tradition.

With the elaboration of architecture in the different parts of the country, each centre became to its own practitioners the central, comprehensive school. This

⁸⁸ Maya is to the Asuras what Viśvakarman is to the gods ('Rāmāyaṇa', IV. 51. 11).—The 'Mānasāra', I. 3-4, derives Vāstu-śāstra from Śiva, Brahmā, Viṣṇu, Indra, Bṛhaspati and Nārada; Nārada belongs to the Southern school.

⁸⁹ He says: "That is called Drāviḍa proportion when the face is 14 aṅgulas long and 12 aṅgulas broad", whereas the general rule is that the face is 12 aṅgulas in length and also in width. The greater length of face, according to Nagnajit, is discussed at length in LVII. 15, and commentary. It distinguishes the facial proportion of 'Drāviḍa' sculptures, such as can be seen from the earliest preserved South Indian sculptures (second century B.C.) through all phases, from those of the rest of India. Nagnajit is one of the 18 preceptors whose names are given in the 'Matsyapurāṇa'.

is true of the South Indian or Drāviḍa branch of the tradition and also of another regional school, which is represented under the name Vārāṭa in the 'Samarāṅgaṇa-sūtradhāra'.

VĀRĀṬA. Vārāṭa is derived from Varād (Berar)¹⁰⁰. The 'Rūpamaṇḍana', III. 5, a treatise on iconography by Sūtrādhāra Maṇḍana, the author of the 'Vāsturājavallabha', of the fifteenth century, mentions the Varāṭas and also the Kirāṭas, whose country lay on the Vindhya. Vārāṭa thus is a territorial division and being derived from Varād (Berar) designates Vidarbha (Berar), which extended from the river Kṛṣṇa to about the Narmadā.

The 'Kāmikāgama', XLIX. 18-20, speaks of the seven storeys, and of the Grīvā, Śikhā and Stūpikā of the pillared—or having pilasters (stambha)—Vārāṭa temples which are thus shown to be storeyed pyramidal buildings surmounted by a High Temple with its walls (grīvā, 'neck'), cupola and finial. They represent type I and, on the whole, belong to the same family as the temples "placed on the top of Meru".¹⁰¹ They are said to be built where Sattva and Rājas are active (ib.), this means where North and South meet. The same is also said of another variety of temples called Kālīṅga; their country, is Kālīṅga, where are the temples of Puri and Bhuvaneśvar, etc. In this regional style however the Southern elements are subordinated to the general 'Northern' Indian form.

These two regional styles are spoken of in the 'Kāmikāgama' after the temples called 'Sārvadeśya' or 'Sārvadeśika' (ib.) which means 'belonging to all countries'. No special rules have been laid down for the form and proportions of their buttressed walls whereas Kālīṅga has been given Southern traits.

Vārāṭa and also Kālīṅga thus are known to the 'Kāmikāgama' as regional styles. From the South Indian point of view of this Āgama, the third term of this ternary, the 'Sārvadeśika', makes allowance for temples which have the Prāsāda Kṣitibhūṣaṇa for their paradigm (p. 251) and which may be built as 'Drāviḍa, Nāgara or Vārāṭa' in the opinion of the 'Samarāṅgaṇasūtradhāra'.

The 'Kāmikāgama' as well as the 'Samarāṅgaṇasūtradhāra' know of Vārāṭa as a regional school of architecture. The 'Kāmikāgama' describes it concisely. It also sums up the main features of the other styles. It describes (śl. 5f) the Nāgara temples as having eight constituent parts (aṣṭavarga) in their elevation. These are: Mūla, 'the root', i.e., the foundation or also the terrace; Masūraka, the socle; Jaṅghā, the 'wall'; Kapota, the cornice; these form the perpendicular portion of the structure and support the Śikhara, Gala, the circular Āmalasāraka and the Kumbha with its Śūla or finial. These are indeed the main parts of a temple of 'Type II'. Its Sukanāsā is also specially mentioned.

S.S. LXIV shows the Vārāṭa temples similar in plan to Nāgara temples; it is not divided according to Kūṭa, Koṣṭha, etc. Their superstructure however does not seem to have been curvilinear.

¹⁰⁰ 'Nāgara, Vesara, Drāviḍa, etc.' by S. Krishnaswami Aiyangar, JISOA, vol. II. p. 23.

¹⁰¹ 'The extant temples in this region however neither conform with the description of Vārāṭa (Vāvāṭa) Prāsādas in S.S. ch. LXIV. nor with that in the 'Kāmikāgama'. The descriptions would more closely fit the temples known as Cālukyan.

Outstanding amongst South Indian Vāstuśāstras in recording the schools of architecture outside the Drāviḍa country, the 'Kāmikāgama' however also establishes the importance of the South Indian school which is its main topic. As an exponent of that school it formulates the theory of the Three Styles: 'Nāgara, Drāviḍa and Vesara' seen under the aspect of the Three Guṇas and representing the sum total of Indian architecture.

VESARA. Vesara, in contradistinction to Varāṭa, is not the name of a country.¹⁰² It means "a mule",¹⁰³ an issue of heterogeneous parents; in plan (vinyāsa) it is Drāviḍa, in the shape of its details (kriyā) it is Nāgara ('Kāmikāgama', ib.). It denotes a mixed style.

Vesara temples are generally assigned to the country between the Vindhya and Agastya (Nasik)¹⁰⁴ or from the Vindhya to the river Kṛṣṇa, as in the 'Kāmikāgama'. It thus seems that Varāṭa and Vesara denote types of certain temples, assigned to the Deccan. But these temples, of 'mixed' type, are preserved to the south of the region allocated to Vesara. They were built by the later Cālukyas, in the Kanarese Districts, and by the Hoysala Dynasty, in Mysore. They represent a school which consolidated its particular style later than the temples having a curvilinear Śikhara or those of the Drāviḍa country. Certain special features of these temples result from an admixture of Nāgara detail to Drāviḍa building; this is natural in a region betwixt two powerful schools of which Nāgara, the first and foremost is centered in Madhyadeśa, according to the 'Aparājitaṭṭhā',—in the country bounded by the river Sarasvati in Kurukṣetra, Allahabad, the Himālayas and the Vindhya,¹⁰⁵ and Drāviḍa in South India.¹⁰⁶ The earlier Cālukya temples (type I) are Drāviḍa in plan, the later are Nāgara in plan.

The 'Bṛhacchilpaśāstra', III. 68 and 73, gives the following lists of the types or styles of temples: beginning with (1) Nāgara, (2) Drāviḍa, (3) Miśraka, (4) Latina, (5) Sādhāra, (6) Bhūmi and (7) Nāgarapuspaka Vimāna, in the first instance; and (1) Nāgara, (2) Drāviḍa, (3) Virāṭa,¹⁰⁷ (4) Bhūmi, (5) Latika,

¹⁰² Nevertheless the I.P. III. XXX. 41 b, distinguishes the Kṣudra-alpa-Vimānas according to countries (deśa) as Nāgara, Drāviḍa and Vesara. Vesara here appears to have become substituted for, or identified with, Varāṭa.

¹⁰³ N.V. Mallayya, JISOA, IX. p. 81 f.

¹⁰⁴ In the I.P., 'Kāmikāgama'; also 'Śilparatna', XVI. 44; this is not so in verses 47-49, see infra. Cf. also K. R. Pisharoti, "Nāgara, Drāviḍa and Vesara", 'Indian Culture', vol. VI. p. 23 f.

¹⁰⁵ N. L. Dey, 'The Geographical Dictionary of Ancient and Mediaeval India', s. v.

¹⁰⁶ The 'Aparājitaṭṭhā', Fol. 25, assigns Nāgara to the Madhyadeśa,—the 'midland' country ('Manu', II. 21); Lāṭi to the Lāṭa country (Gujarat—in the main but also as far east as Gwalior—), Drāviḍi to the South and Vairāṭi to its own country. Re: Vairāṭi, see note 107.

¹⁰⁷ Virāṭa or Matsya had Vairāṭa (Bairat) for its capital; Bairat is situated to the North of Jaipur, Rajputana. Although it has nothing to do with Varāṭa, a later compilation like the 'Bṛhacchilpaśāstra' might have altered the spelling of the label of an architectural style.—cf. also the 'Naiśādhacarita', XVI. 117 which speaks of Varāṭarāt or Virāṭarāt according to some commentaries as well as of Vidarbharāt. S. S. LXIV treats of 12 Vāvāṭaprasādas. Twice the Amalasāraka is mentioned as an optional substitute for the Ghaṇṭā (the cupola in its later Cālukyan shape). No such superstructures are in existence.—Varāṭa, it appears, is the name of a mixed type. Its location can not as yet be ascertained. 'Vairāṭi to its own country';

(6) Sādhāra and (7) Miśraka, in the second. This, though a late compilation, is full of interest. Miśraka is third after Nāgara and Drāviḍa, and so is "Virāṭa". Miśraka, indeed, is Virāṭa which seems to have been substituted for Varāṭa.

The lists of the varieties of the temples in later Vāstu-śāstras are always headed by Nāgara, once the universal and the leading 'style'. Next in importance and consolidated in its own particular form is the type of temples called Drāviḍa while Varāṭa or Vesara, the mixed type of the Southern Deccan, was still near its experimental stage when the 'Samarāṅgaṇasūtradhāra' was compiled.

At all times, however, from the 'Bṛhat Saṃhitā' onwards, and probably earlier, Nāgara were the most numerous temples; their centre seems to have been Madhyadeśa. From this centre, under the patronage of the respective ruling dynasties, the specific types of temples (p. 270A) built there were seen to develop local variations of their own, in the countries to the East (Kaliṅga) and West (Lāṭa). In Orissa (Kaliṅga) as well as in Western India (Lāṭa), the 'Universal' or Nāgara style was developed in distinct varieties.

Having its centre in Madhyadeśa, temples were built in the Nāgara style, from the Himālayas in the North, to the East and West coasts of India and as far South as the river Tungabhadra. The actual extent of the varieties of the Nāgara temples exceeds, in the Southern direction, the limits given in the Vāstu Śāstras to the style 'Nāgara'. The regional schools became known in Vāstu Śāstra under the name of their respective countries of origin.¹⁰⁸ While this took place, the Drāviḍa school seems to have been especially prolific in laying down the characteristics (lakṣana) of its own type and to prove its importance in the whole of Indian architecture. This is shown by its terminology.

DRĀVIḌA : "NĀGARA, VESARA AND DRĀVIḌA". The ternary, Nāgara, Drāviḍa and Vesara, in agreement with the three-fold geographical division of India into the North, the Deccan and the South comprises the entire extent, though not the range of Hindu temples in India.¹⁰⁹ The 'Īśanaśivagurudevapaddhati' (III. ch. XXX. 41f), however, makes it clear that in this Śāstra the triple distinction Nāgara, Drāviḍa and Vesara applies to Kṣudra-alpa-Vimānas only, the very small or diminutive shrines, the High Temples (Vimāna, Harmya) on the head of Meru.

The temples, in the 'Īśanaśivagurudevapaddhati', III. XXX. 1-35, classified as Mukhya Vimānas, or the chief and largest of the Jāti Vimānas, the South Indian Vimānas or the "Collective temples", represent each a collection of various classes, namely the storeyed temples, on the head of which is placed a small shrine (the 'Vimāna' described in Part VI) plus a rampart of chapels surrounding each storey.

does this mean Virāṭa? The 'Bṛhacchilpaśāstra', III. 73, Comm. speaks of Virāṭa temples in Kaliṅga and of Latina temple in Virāṭa.

¹⁰⁸ The diffusion of the various 'styles' went far beyond their original home whence they derived their names in Vāstuśāstra (for example, the Kailāsanātha Temple in Elura (Aurangabad), a 'Drāviḍa' temple; temples in Kurnool, Raichur and the Kanarese Districts, are "Nāgara". The Cālukya and Hoysala temples which seem to correspond to the descriptions of Varāṭa (-or 'Vesara') temples belong to the South of Berar (Varāḍ).

¹⁰⁹ Certain 'ab-original' types such as the wood and stone or brick temples of Malabar are not specially named in the Vāstu-śāstras. See however Kerala, a 12 storeyed temple, note 112.

The Jāti Vimānas are further recognised as Chanda, or Vikalpa or Ābhāsa Vimānas, according to the different arrangement of the several kinds of chapels of which the rampart consists ('Mayamata' XXII. 77).¹¹⁰ The chapels are called Kūṭa, Koṣṭha, Nīda or Pañjara, etc., according to their different shapes (see Figs. on p. 185f). They are lesser constituent parts (anukāya aṅga; I.P. III. XXX. 35-41).

The group of temples enumerated after the Mukhya and other kinds of Jātivimānas are the Alpa Vimānas or Kṣudra Vimānas, the "Small temples".

The complete South Indian temple is a Jāti Vimāna. The Mukhya Vimānas, etc., are but specially large Jāti Vimānas whereas the Alpa Vimānas, also called Kṣudra Vimānas, are not complete "collective temples". They consist of the perpendicular "cube" or prism of the walls of the Garbhagrha on whose flat roof is placed another smaller shrine which is domed (Fig. e on p. 185). The Alpa Vimānas strictly consist of the Vimāna only which is placed "on the head of Meru".¹¹¹

After the discussion of the lesser parts, the Anukāya-aṅgas of a Jāti-Vimāna, the 'Īśānaśivagurudevapaddhati' says of the Kṣudra-alpa-Vimāna, the "very small shrine" or the High Temple, which crowns the whole assembly of chapels, that this small shrine is distinguished as Nāgara, Drāviḍa and Vesara (verses 41-42).

Following the 'Īśānaśivagurudevapaddhati' III. ch. XXX, 41 f., the "diminutive temple" (Kṣudra-alpa Vimāna), the High Temple, of the type Nāgara is square or rectangular, its quality is 'sāttvika', its locality is the country between the Himālayas and Vindhya hills; Drāviḍa is 'rājasa'; the Drāviḍa country and none else is suitable for the chapel-type Drāviḍa. This is described as six sided or eight sided, of even sides, a regular octagon, etc., or an oblong octagon, or the small temple may also be square below its neck (gala) only, its roof-shape however may have the appearance of a dome in eight sections. Vesara is 'tāmasa'; it is assigned to the country lying between Agastya (near Nasik) and the Vindhya. Vesara should be circular or elliptical (vṛttāyata) or 'dvyaśravṛtta', which means having one pair of opposite sides straight and the other pair curved, or Vesara may also be square below the neck, i.e., the small High Temple has four straight walls and is circular above them, so that a round dome-shape (śikhara) rests on them.¹¹²

The schematism of the division of the whole of India according to the prevalence of the three Guṇas and the three styles is not to be taken literally. Temples of the

¹¹⁰ Cf. also I.P. III. ch. XXVIII. 40-41; XXX. 1-18; 'Kāmikagāma', XLV. 19, 20 and LV. 123-30.

These names also denote different sizes of the South Indian "Collective Temples", Acharya, 'Dictionary', s. v.

¹¹¹ In subsequent centuries, rudiments of the chapels of the parapet, or the images by which these were filled or replaced adorn also the Alpa-Prāsādas.

¹¹² The same shapes of the Śikhara, i.e. the 'dome' of the High Temple are given in I.P. IV. ch. XXXII. 65 f. There, the proportionate height of the several 'Śikharas' is given. They are called each by a name of its own, which has a geographical origin; see note 57. South Indian Vāstu-śāstras give geographical labels to their manifold classifications of the buildings and their parts. The 'Mānasāra', XXX. 5-6, treats of 10 varieties of 12 storeyed temples: they are named after countries such as Pāñcāla, Drāviḍa, Kāliṅga, Virāṭa (cf. Varāṭa), Kerala, Māgadha, etc. The 'Kāśyapaśilpa', XXVII. 55, on the other hand, classifies a certain kind of one storeyed building as 'Kosala', and types of two storeyed buildings as Pāñcāla and Gāndhāra.

Nāgara Type are to be found as far south as Kurnool (Tungabhadra); those of the Drāviḍa School as far north as Elura.

In some of the texts moreover ('Kāśyapa Śilpa', XXV. 19-20; 'Śilparatna', XVI. 47-49) Drāviḍa and Vesara have been made to change place. The totality of the extent, all over India, of the main shapes of the High Temple is expressed by the ternary Nāgara, Drāviḍa, Vesara; and it does not matter in this particular classification with what part of India the one name is associated or the other.

The implications of this are made explicit by the 'Śilparatna', XVI. 51-53. This most carefully compiled text speaks of Nāgara, square from the bottom to the Śikhara; of Drāviḍa, whose body is square and its dome shape is six sided or Drāviḍa is eight-sided as in the above descriptions and of Vesara as 'circular' as also described in the 'Īśānaśivagurudevapaddhati'. These rules, however, says verse 53 of the 'Śilparatna', XVI, very clearly, are for the Harmya only, and not for the Kūṭa, Koṣṭha, etc.; the latter are the chapels of the rampart or enclosure whereas the Harmya is the diminutive High Temple which crowns the Prāsāda.

The South Indian collective temples, the Jātivimānas, Jātītara and also the Mukhya Prāsādas with the storeyed pyramid of their superstructure are classified as Nāgara, Drāviḍa and Vesara according to the shape of their High Temple, the Harmya or 'Kṣudra-alpa Vimāna'.¹¹³

The High Temple (Vimāna, Harmya) which crowns the Prāsāda of Gangaikondacolapuram of the 11th Century (near Kumbhakonam)¹¹⁴ is circular. This Prāsāda would thus be a Vesara Prāsāda of the Drāviḍa school of architecture, whereas the Koraiganātha temple at Śrīnivāsanāthur, Trichinopoly District would be a Nāgara temple amongst the Jāti Vimānas of the Drāviḍa school. The terms 'śaḍaśra' and 'aṣṭaśra', in this connection, seem to denote the number of sections of the 'dome' or Śikhara of the High Temple crowning the superstructure; it is octagonal on the Shore temple at Mamallapuram (Fig. on p. 185) and on the Brhadīśvara Temple in Tanjore (Fig. on p. 187). These are Drāviḍa Prāsādas of the Drāviḍa or South Indian school.

The classification Nāgara, Drāviḍa, Vesara of the South Indian Vāstuśāstras is an expression of the exuberance of the builders. They call their types and patterns after the various schools, and after the main regions of India, giving in this way a universal value to their work. Nāgara, therefore heads the list; it is square, for the square is the perfect shape.¹¹⁵

The ternary furthermore is made to imply not only the wholeness of India, but also the completeness of the three Guṇas (Sattva, Rajas, Tamas), and the other ternaries as symbols of totality: three world ages, three Principles of manifestation, three great Gods, three castes, etc.¹¹⁶

¹¹³ Overlooking these unmistakable instructions of Vāstuśāstra, modern scholars have stretched on Procrustean beds their explanations of the terms Nāgara, Drāviḍa and Vesara, as defined in the South Indian texts, cf. K. R. Pisharoti, l. c.

¹¹⁴ P. Brown, op. cit. Pl. LVIII, Fig. 1.

¹¹⁵ The transfer of names is frequent in Vāstuśāstra. Meru, first amongst the Twenty Temples of the 'Brhat Samhitā' comes to denote the first or leading type of a series of temples. As such it is described in the Ī.P. III. XXVIII. 10; XXIX. 5, having but three, four or five storeys only and leading the list of the Jātītara, the second series of temples.

¹¹⁶ 'Īśānaśivagurudevapaddhati', III. XXX. 47.

As the Jātivimāna had come to be the collective monum into which were gathered several types of the temple so also is the South Indian village or town the place in which the several varieties of the temple are assembled. Nāgara temples in the North, North-West and North-East,—reminiscent of the Northern provenience of this variety, and Drāviḍa temples in the South of the cardinal points expressive of their particular importance. Drāviḍa temples may also be built in the North-West and North-East, where they would alternate with Nāgara temples, leaving the North proper to the Nāgara shrines exclusively.

Vesara temples are to be built in the East and the West. These two cardinal directions they share with the Drāviḍa Temples. They should also be built in the South-East and South-West leaving the South proper to Drāviḍa temples exclusively as it is the Southern Indian Temple proper. Besides these temples, Sārvadeśika temples may be built in all the directions (mukhāgama' XLIX. 124-127; see chart, p. 234).¹¹⁷

¹¹⁷ In verse 132, ib., Vesara temples moreover are assigned to the centre the four directions and to the South-West. Preference seems here given to the circular cupa, whereas in the former passage the polygonal (octagonal, etc.) dome shape of the Drāviḍa type was the most widely recognised. The latter may be built even at the sides of the temple (śl. 126)—and also in the eight directions (śl. 135); cf. p. 233.

The earliest South Indian reference to the circular Vesara'ivā and khara and also to 'Drāviḍi' is in the 'Vaikhānasāgama' VI, lines 6-7.
